Errata

Title & Document Type: 3561A Dynamic Signal Analyzer Service Manual, Volume 1

Manual Part Number: 03561-90010

Revision Date: March 1, 1990

HP References in this Manual

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, semiconductor products and chemical analysis businesses are now part of Agilent Technologies. We have made no changes to this manual copy. The HP XXXX referred to in this document is now the Agilent XXXX. For example, model number HP8648A is now model number Agilent 8648A.

About this Manual

We've added this manual to the Agilent website in an effort to help you support your product. This manual provides the best information we could find. It may be incomplete or contain dated information, and the scan quality may not be ideal. If we find a better copy in the future, we will add it to the Agilent website.

Support for Your Product

Agilent no longer sells or supports this product. You will find any other available product information on the Agilent Test & Measurement website:

www.tm.agilent.com

Search for the model number of this product, and the resulting product page will guide you to any available information. Our service centers may be able to perform calibration if no repair parts are needed, but no other support from Agilent is available.

Warning

To prevent potential fire or shock hazard, do not expose equipment to rain or moisture.

SAFETY SUMMARY

The following general safety precautions must be observed during all phases of operation, service, and repair of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. Hewlett-Packard Company assumes no liability for the customer's failure to comply with these requirements. This is a Safety Class 1 instrument.

GROUND THE INSTRUMENT

To minimize shock hazard, the instrument chassis and cabinet must be connected to an electrical ground. The instrument is equipped with a three-conductor ac power cable. The power cable must either be plugged into an approved three-contact electrical outlet or used with a three-contact to two-contact adapter with the grounding wire (green) firmly connected to an electrical ground (safety ground) at the power outlet. The power jack and mating plug of the power cable meet International Electrotechnical Commission (IEC) safety standards.

DO NOT OPERATE IN AN EXPLOSIVE ATMOSPHERE

Do not operate the instrument in the presence of flammable gases or fumes. Operation of any electrical instrument in such an environment constitutes a definite safety hazard.

KEEP AWAY FROM LIVE CIRCUITS

Operating personnel must not remove instrument covers. Component replacement and internal adjustments must be made by qualified maintenance personnel. Do not replace components with power cable connected. Under certain conditions, dangerous voltages may exist even with the power cable removed. To avoid injuries, always disconnect power and discharge circuits before touching them.

DO NOT SERVICE OR ADJUST ALONE

Do not attempt internal service or adjustment unless another person, capable of rendering first aid and resuscitation, is present.

USE CAUTION WHEN EXPOSING OR HANDLING THE CRT

Breakage of the Cathode-ray Tube (CRT) causes a high-velocity scattering of glass fragments (implosion). To prevent CRT implosion, avoid rough handling or jarring of the instrument. Handling of the CRT shall be done only by qualified maintenance personnel using approved safety mask and gloves.

DO NOT SUBSTITUTE PARTS OR MODIFY INSTRUMENT

Because of the danger of introducing additional hazards, do not install substitute parts or perform any unauthorized modification to the instrument. Return the instrument to a Hewlett-Packard Sales and Service Office for service and repair to ensure that safety features are maintained.

DANGEROUS PROCEDURE WARNINGS

Warnings, such as the example below, precede potentially dangerous procedures throughout this manual. Instructions contained in the warnings must be followed.

> **WARNING**
>
> Dangerous voltages, capable of causing death, are present in this instrument. Use extreme caution when handling, testing, and adjusting.

GENERAL INFORMATION

SAFETY SYMBOLS

General Definitions of Safety Symbols Used On Equipment or In Manuals.

⚠ Instruction manual symbol: the product will be marked with this symbol when it is necessary for the user to refer to the instruction manual in order to protect against damage to the instrument.

↯ Indicates dangerous voltage (terminals fed from the interior by voltage exceeding 1000 volts must be so marked).
⏚ OR ⏚ Protective conductor terminal. For protection against electrical shock in case of a fault. Used with field wiring terminals to indicate the terminal which must be connected to ground before operating equipment.

⏚ Low-noise or noiseless, clean ground (earth) terminal. Used for a signal common, as well as providing protection against electrical shock in case of a fault. A terminal marked with this symbol must be connected to ground in the manner described in the installation (operating) manual, and before operating the equipment.

/// OR ⊥ Frame or chassis terminal. A connection to the frame (chassis) of the equipment which normally includes all exposed metal structures.

∿ Alternating current (power line).

⎓ Direct current (power line).

≋ Alternating or direct current (power line).

WARNING The WARNING sign denotes a hazard. It calls attention to a procedure, practice, condition or the like, which, if not correctly performed or adhered to, could result in injury or death to personnel.
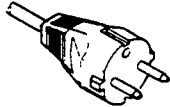

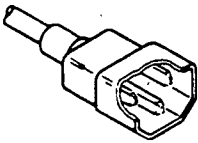

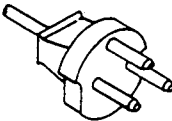

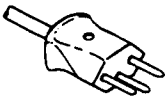

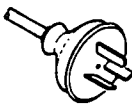

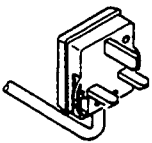

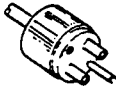

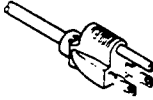

CAUTION The CAUTION sign denotes a hazard. It calls attention to an operating procedure, practice, condition or the like, which, if not correctly performed or adhered to, could result in damage to or destruction of part or all of the product.

NOTE: The NOTE sign denotes important information. It calls attention to procedure, practice, condition or the like, which is essential to highlight.

SECTION I
GENERAL INFORMATION

1-1 INTRODUCTION

This service manual provides all the information required by service personnel to test, adjust, and service the -hp-3561A Dynamic Signal Analyzer. Figure 1-1 shows the -hp-3561A with the accessories supplied.

The Service Manual is divided into seven sections, each covering a particular topic for the servicing of the -hp-3561A. A brief description of each section is given in Table 1-1.

This service manual is designed for troubleshooting the -hp-3561A in a two step process. In step one, the information given in Section 6 is used to isolate the failure to the circuit board level. Once the failure is isolated to a circuit board, the information given in Section 7 is used to further isolate the failure to the component level. The troubleshooting procedure given below describes the standard troubleshooting process.

HOW TO USE THE TROUBLESHOOTING PROCEDURES

Troubleshooting Procedure:

1. Observe the failure symptoms.
   -Does the failure affect any front panel keys?
   -Does the failure result in a Cal Failure message?
   -Does the power up test fail with an Error Return Code?

2. Check paragraph 6-7, Troubleshooting Guidelines, for the failure symptom.
   If the symptom is listed, start the fault isolation procedure with the indicated test.

3. If the failure results in a Cal Failure message, refer to paragraph 6-6, Calibration Failures. Start the fault isolation procedure with the indicated test.

4. If the power up test fails with an Error Return Code, start the fault isolation test with TEST B.

5. When in doubt, start the fault isolation test with TEST A.

6. Proceed with the fault isolation test until the failure is isolated to a circuit board.
   -If the failure is not detected by the fault isolation procedure, the performance test (Section 2) can be used to further test the -hp-3561A operation.

7. Once the Failure is isolated to a circuit board, proceed to isolate the failure to a component using the information given in Section 7.
   -If the circuit board is out of adjustment, refer to the adjustment procedures given in Section 3.

Table 1-1 Manual Section Descriptions

Section	Title	Description
I	GENERAL INFORMATION	This section contains information on how to use this manual. Also included are Safety Considerations, Recommended Test Equipment, and the -hp-3561A performance specifications.
II	PERFORMANCE TEST	The Performance Test section contains the procedure used to verify the instrument's performance specifications which are listed in Table 1-4. Also included is the Operational Verification procedure, which can be used for post repair verification or incoming inspection.
III	ADJUSTMENTS	This section describes the adjustment procedures which will return the instrument to peak operating condition after repairs are completed or for periodic preventative maintenance.
IV	REPLACEABLE PARTS	In this section, the replaceable parts are listed in order of their reference designation. This section also contains the information on how to order these parts.
V	BACKDATING	The Backdating section has the modification information necessary to adapt this service manual to -hp-3561As which were manufactured before the printing of this manual.
VI	FAULT ISOLATION	The Fault Isolation section contains the information needed to isolate failures to the circuit board level. Also included is an explanation of the Cal Failure messages, a description of the various internal diagnostic test routines, and an overall instrument theory of operation.
VII	SERVICE	This section contains the schematic diagrams, assembly level theory of operation, component level troubleshooting and component locators. They are organized in assembly reference designation order from A10 through A99.

1-2   MANUAL/INSTRUMENT IDENTIFICATION

The instrument identification serial number is located on the rear panel of the instrument. Hewlett-Packard uses a two-section serial number consisting of a four digit prefix and a five digit suffix separated by a letter designating the country in which the instrument was manufactured (A = U.S.A.;G = West Germany;J = Japan;U = United Kingdom). The prefix is the same for all identical instruments and changes only when a major instrument change is made. The suffix, however, is assigned sequentially and is unique to each instrument. The contents of this manual apply directly to instruments having the same serial number prefix as listed on the title page of this manual.

Instruments manufactured after the printing of this manual may have a serial prefix that is not listed on the title page. This unlisted prefix indicates that the instrument is different from those documented in this manual. The manual for this instrument is supplied with a yellow Manual Changes supplement which contains change information that documents the differences.

In addition to change information, the supplement may contain information for correcting errors in the manual. To keep this manual as accurate and current as possible, Hewlett-Packard recommends that you periodically request the latest Manual Changes supplement.

Listed on the title page of this manual is a manual part number and a microfiche part number. The manual part number can be used to order extra copies of this service manuals. The microfiche part number can be used to order 4 by 6 inch microfilm transparencies of this service manual.

1-3 INSTRUMENT DESCRIPTION

The -hp-3561A is a high performance, single channel Dynamic Signal Analyzer designed for portable or bench use. Its frequency coverage of 0 to 100kHz with a dynamic range of 80dB makes it suitable for vibration and rotational machinery analysis, as well as audio and general purpose electronic measurements.

Fast Fourier Transform (FFT) and Digital Filter technology is used in the -hp-3561A as well as a raster scan CRT and a line switching power supply. HP-IB is standard with the ability to plot directly to an HP-GL plotter with its own built-in software eliminating the need for a controller.

1-4 OPTIONS

There are four options available to the -hp-3561A. They are available either when the instrument is ordered or for later installation. These options are listed in Table 1-2.

Table 1-2 -hp-3561A Options

Option	Description
001	Bubble Memory
908	Rack Mounting Kit
910	Extra Operating Manual
910	Extra Service Manual

1-5 SAFETY CONSIDERATIONS

The -hp-3561A is a Safety Class 1 instrument (provided with a protective earth terminal). Although this instrument has been designed in accordance with international safety standards, this manual contains information, cautions and warnings which must be followed to ensure safe operation and to retain the -hp-3561A in safe operating condition. Service and adjustments should be performed only by qualified personnel who are aware of the hazards involved.

1-6 OPERATOR MAINTENANCE

Operator maintenance is limited to replacing the line fuse and cleaning the fan filter. There are no operator controls or user serviceable parts inside the -hp-3561A. Only trained service personnel should perform instrument repairs.

WARNING

To avoid serious injury, disconnect the ac line power cord before removing or installing the ac line fuse.

WARNING

Only fuses with the required rated current and specified type should be used for replacement. The use of repaired fuses and short circuiting of fuse holders is not permitted. Whenever it is likely that the protection offered by the fuse has been impaired, the -hp-3561A must be made inoperative and secured against any unintended operation.

WARNING

Under no circumstances should an operator remove any covers, screws, or in any other way enter the -hp-3561A. There are no operator controls inside the -hp-3561A.

1-7 POWER REQUIREMENTS

CAUTION

Before applying ac line power to the -hp-3561A, ensure that the voltage selection switches on the bottom of the instrument are set for the proper line voltage and that the correct line fuse is installed in the rear panel fuse holder.

The -hp-3561A can be operated from any single phase ac power source supplying 100V, 120V, 220V, or 240V (-10% to +5%). For 100/120V power, the -hp-3561A can be operated in the frequency range of 48-440 Hz. For 220/240V power, the -hp-3561A can be operated in the frequency range of 48-66 Hz. Power consumption is less than 120VA. Refer to Figure 1-2 for the line voltage ranges and Figure 1-3 for the switch positions and fuse selection verses voltage range.

1-8 AVAILABLE SERVICE KIT

A Service Kit, HP part number 03561-84401, is needed to repair the -hp-3561A. This service kit can be ordered through your local HP sales office. Refer to Section 5, Replaceable Parts, for ordering instructions. Included in the kit are special adapter cables, extender boards and a circuit module for servicing the Bubble Memory option. Table 1-3 lists the contents of the -hp-3561A Service Kit.

Table 1-3 -hp-3561A Service Kit Contents

Description	Qty.	-hp- Part Number
BNC-J Cable Adapter	1	03585-61616
J Male-Male Adapter	1	1250-0669
Bubble Memory Reseed Module	1	1818-3304

PC Extender Board 22 Dual Pin	1	03561-66596
Adjustment Tool .1 inch Hex	1	8710-1388

1-9 PERFORMANCE SPECIFICATIONS

The -hp-3561A performance specifications are listed in Table 1-4. These specifications are the performance standards or limits against which the -hp-3561A is to be tested.

Table 1-4 -hp-3561A Performance Specifications

3561A SPECIFICATIONS

Specifications describe the instrument's warranted performance
Supplemental characteristics are intended to provide information useful in
applying the instrument by giving typical, but non-warranted, performance
specifications Supplemental characteristics are denoted as 'typical,'
'nominal,' or 'approximately.'

Frequency and Time

MEASUREMENT MODES:

Narrowband: 125 μHz to 100,000 Hz frequency range. Resolution is frequency span/400 All window, trigger and averaging types are available.

Phase: Phase spectrum is available with or without triggering. When triggered, phase is referenced to the trigger.

⅓ Octave: 0.8 Hz to 80 kHz - see separate Octave section.

Full Octave: 1 Hz to 63 kHz - see separate Octave section

Time Capture: Time record can be extended from 1k to 40k samples of continuous input data. Up to 40x zoom expansion factor can be applied to this data

External Sampling: Input sample rate can be externally controlled up to 256 kHz TTL compatible sample rate input on rear panel (Note Some specs may be degraded in external sample mode)

FREQUENCY SELECTION:

0 to 100 kHz: Measurement is made over the full frequency range of the analyzer with 250 Hz resolution.

Define Start or Center: Measurement is made over the selected frequency span. Start or center frequency can be set anywhere in the 0 to 100 kHz range with resolution of 0.25 Hz

Define Span: Measurement frequency spans are provided in a 1, 2, 2.5, 5, 10 sequence. (Other spans exist between these intervals, but are too numerous to list in the space available.)

Define Time Length: Measurement time can be set from 0.004 seconds to 651 minutes per time record. Time setting is rounded up to agree with next available span.

ACCURACY:

Frequency Accuracy: ± 0.003% of frequency reading

RESOLUTION:

Frequency Resolution: Span/400

SPANS:

	Zoom	Baseband
# spans available	43	52
min span	0.25 Hz	0.01 Hz
max span	100 kHz	100 kHz
time record length	400/span	400/span
resolution	span/400	span/400

MEASUREMENT WINDOWS:

Windows are weighting functions which are applied to input data to reduce measurement errors due to leakage.

Flat Top: Provides optimum amplitude accuracy.

Hann: Provides an amplitude accuracy/frequency resolution compromise. Useful for general purpose and measurements using random noise.

Uniform: Equal weighting of the time record for measuring transients, or response measurements using the internal periodic noise source.

Exponential: Variable exponential decay weighting is applied to the time record. Useful for transients which have a duration greater than the time record.

Window Parameters:

	Flat Top	Hann	Uniform
Noise Equiv. BW (% of span)	0.955	0.375	0.25
3dB BW (% of span)	0.90	0.37	0.25
Shape factor (60dB BW/3dB BW)	2.6	9.1	716

TYPICAL REAL TIME BANDWIDTH:

Operating mode	Real time bandwidth	Spectra sec
HP-IB transfer	750 Hz	1 9
Single display	3 kHz	7.5
Fast Averaging	7.5 kHz	20

Amplitude and Input

AMPLITUDE:

Input Range: The calibrated input range is 27 dBV (+ 22.4 V) to -51 dBV (3 mV) maximum input level (single tone RMS). Range is adjustable in 1 dB (10%) increments

Autorange: The optimum input range is automatically selected prior to processing. This feature can be deactivated.

Amplitude Overload/Underload: Overload occurs when the input level exceeds input range by nominally 1.0 dB or 10%. Overload measurements can be automatically rejected during averaging The HALF range indicator lights when input signal is within 6 dB of full scale

Dynamic Range: Distortion, spurious and alias products ≥80 dB below input range

DC Response: (With Auto-Cal on)
- 27 dBV to - 35 dBV: >30 dB below input range
- 36 dBV to - 51 dBV: >20 dB below input range

Amplitude Marker Resolution:
Log 0.01 dB
Linear: 4 digits

Amplitude Accuracy:
Full Scale Accuracy at calculated frequency points Overall accuracy is the sum of absolute accuracy, window flatness and noise level.

Absolute Accuracy:
± 0 15 dB ±0.015% of input range.
+ 27 dBV to - 40 dBV
±0.25 dB ±0.025% of input range.
- 41 dBV to - 51 dBV

Window flatness:
Flat top: +0, -0.01 dB
Hanning: +0, -1.5 dB
Uniform: +0, -4.0 dB

Noise Level: Flat top filter, 50Ω source impedance, 20 Hz to 1 kHz (1 kHz span) < - 131 dBV (- 141 dBV/√Hz)
2 kHz to 100 kHz (100 kHz span) < - 120 dBV (- 150 dBV/√Hz)

Phase Marker Resolution: 0.1 degree
Phase Accuracy: ±2°, dc-10 kHz. ±10° 10 kHz - 100 kHz referenced to the trigger point.

INPUT:

Input Impedance: 1MΩ ±5% shunted by 95 pF maximum
Floating Ground to Case Capacitance: < 0.25 μF

DC Isolation: Input low may be connected to chassis ground or floated up to 30 volts RMS (42 Vpk).

Input Coupling: The input signal may be ac or dc coupled. Low frequency 3 dB roll off < 1.0 Hz for ac.

Anti-Alias Filter Roll-Off: Analog and digital anti-aliasing filters roll off at a nominal rate of 130 dB/octave with a cut-off frequency at 105 kHz nominally.

A-Weight Filter: The hardware A-weight input filter conforms to ANSI Standard S1.4-1971.(R.1976)

ICP Current: Nominal 4 mA current source provided on input BNC connector. Compatible with Integrated Circuit Piezoelectric accelerometers. Open circuit voltage is 24 volts nominal.

1-7

Table 1-4 -hp-3561A Performance Specifications (Cont'd)

Octave Analysis

The measurement is made in synthesized ⅓ or full (1/1) octave bands. Filter bandwidth, center frequency, and bandshape meet ANSI Class III (Class II for full octave) specifications.

	# Bands Available	# Bands Displayed
1/3	51	33
1/1	17	11

1/3 and 1/1 Octave Analysis Parameters:

	Band center Frequency Range	Data Collection Time	Band #'s Displayed
1/3 Octave	50 Hz to 80 kHz	0.4 sec	17 to 49
	25 Hz to 40 kHz	0.8 sec	14 to 46
	12.5 Hz to 20 kHz	1.6 sec	11 to 43
	6.3 Hz to 10 kHz	3.2 sec	8 to 40
	3.15 Hz to 5 kHz	6.4 sec	5 to 37
	1.6 Hz to 2.2 kHz	12.8 sec	2 to 34
	0.8 Hz to 1.25 kHz	25.6 sec	-1 to 31
1/1 Octave	63 Hz to 63 kHz	0.4 sec	18 to 48
	31.5 Hz to 31.5 kHz	0.8 sec	15 to 45
	16 Hz to 16 kHz	1.6 sec	12 to 42
	8 Hz to 8 kHz	3.2 sec	9 to 39
	4 Hz to 4 kHz	6.4 sec	6 to 36
	2 Hz to 2 kHz	12.8 sec	3 to 33
	1 Hz to 1 kHz	25.6 sec	0 to 30

Computation Time: 1/3 octave and 1/1 octave computation is made in less than 0.80 seconds

Trigger

TRIGGER MODES: **Free Run:** A new measurement is initiated by completion of the previous measurement.

External: A new measurement is initiated by a TTL pulse applied to the rear panel external trigger input.

Internal: Allows measurements to be initiated by pressing manual arm.

Input: A new measurement is initiated when the input signal meets the defined trigger level conditions.

Source: New measurements are synchronized with the internal source.

HP-IB: A new measurement is initiated by sending a group execute trigger from an external controller over the HP-IB.

TRIGGER ARM: **Auto Arm:** Measurements are initiated automatically when trigger conditions are met.

Manual Arm: Enables a single measurement when the trigger conditions are met.

TRIGGER LEVEL: Triggering can be set to occur when the input reaches a user definable input level. Definable from 0 to 110% of full range setting. Positive and negative levels and slopes can be set.

TRIGGER DELAY: **Pre-Trigger:** The measurement can be based on input data from 1/1024 to 8 time records before trigger conditions have been met, with resolution of 1/1024 of a record. Time capture mode can be used for pre-trigger delays of up to 40 records.

Post-Trigger: The measurement is initiated from 1/1024 to 1023 time records after trigger conditions have been met. Resolution is 1/1024 of a record.

Measurement Averaging

AVERAGING TYPES: **RMS:** For each calculated frequency point the displayed amplitude is averaged in a root mean square fashion.

Peak Hold: Same as RMS except the maximum amplitude value is stored for each frequency bin. Phase is not available.

RMS Exponential Weighting: After each spectrum measurement the average is updated by weighting the new spectrum and the previous average as follows, where k is a user defined factor.

$$A_i = (1-k)A_{i-1} + (k)A_{new}$$

Time: For each calculated frequency point the displayed amplitude and phase are averaged linearly. In this mode, a trigger signal is required, and signals that are not synchronous with the trigger will average toward zero.

Number of Averages: 1 to 16,383.

AVERAGE CONTROL: **Start:** Starts a new average or measurement.

Pause/Cont.: Pauses the average, or continues a paused average.

Overload Reject: Automatically detects and rejects overloaded blocks from the average.

Fast Display: Provides maximum averaging rate by not displaying intermediate results.

Normal Display: The average is computed and displayed for each new spectrum.

Repeat Display: The Repeat Display function inhibits the display of intermediate average results. Only the final computed average is displayed, and then the measurement is restarted. Available in RMS and time average modes only.

Source

Band limited, band translated pseudo random, random, impulse or TTL "sync" signals are available on the rear panel. Impulse produces nominal 2 V peak into 50 Ω, with no attenuation.

Impedance: 50 ± 5 ohms.

LEVEL AND ACCURACY:	Baseband	All spans*	0.7 V rms ± 10%
	Zoom	All spans	0.5 V rms ± 15%

* Random Source in 0-100 kHz span has level accuracy of ±20%.

FLATNESS:			Periodic	Random**
	Baseband	0-50 kHz	±0.7 dB	±0.7 dB
		0-100 kHz	±0.8 dB	±1.6 dB
	zoom	all spans	±2.0 dB	±2.0 dB

** Random Source flatness approaches these specs as number of RMS Averages increases.
Note: All zoom flatness specs are valid if center frequency >0.7 × span

ATTENUATION:	(nominal 1.5 dB steps)	max attenuation
	pseudo random, random	40.5 dB
	impulse	30 dB

Table 1-4 -hp-3561A Performance Specifications (Cont'd)

Display

Magnitude, Phase, Time and Math traces may be selected. Units available are: Horizontal: Hz, Seconds, RPM, and Orders with linear or logarithmic spacing. Vertical: Volts, dBV, dBm (selectable R), and user defined units.

MAGNITUDE:

Log: 0.5 to 40 dB/division. Units of dBV, dB relative, dBm (user defined impedance) and dBEU are provided.

Linear: Constant volts/division, milliwatts/division, or user defined units/division.

PHASE:

Resolution: 0.1 degree with marker

Display Range: ±240 degrees about user definable center reference. (±320 degrees)

TIME:

Resolution = Time Record Length (sec)/400

Display Range: ±110% of input range.

MATH:

Arithmetic operations can be performed on new and recalled traces. Addition, subtraction, multiplication, division, single and double integration, differentiation and user definable constants are provided. 1/BW is provided for PSD computations.

FORMAT:

Single: Selected data is displayed on full CRT trace height.

Front-Back: Two selected traces are displayed simultaneously, full CRT height. Back trace has no marker and is displayed at "half bright" intensity.

Upper-Lower: Two one-half height traces can be displayed.

Map: 1 to 60 amplitude spectra may be displayed simultaneously in a "spectral map" display. These may be consecutive measurement spectra, stored traces, or transformed from time capture records.

SCALE:

Linear or Log magnitude scales may be selected. Full scale, dB/div, and degrees/div are user definable. Center scale definable in time or phase traces.

Autoscale: Provides a one time automatic scaling of data to optimize display scale and units per division for best view.

Internal Memory

	Traces + States (non-volatile)	Time Buffer (volatile)
Standard	2 traces + 6 states	40 time records
Option 001	traces + states + (1 + 2 × time capture records) = 127	40 time records

Marker

Single: Provides precision readout of X and Y axis values of currently displayed units. MKR — Peak, MKR — Center Frequency, MKR — Full Scale and Peak-track are provided. Relative marker provides measurements relative to a reference which can be set with the single marker or user-defined X and Y axis unit settings.

Band Power: Two independently controllable markers may be used to calculate power in a given band.

Harmonic: Up to 20 harmonics of the selected fundamental are marked. T.H.D. is calculated and displayed.

Sideband: Up to 10 modulation sidebands can be marked. Carrier frequency is user definable. The ratio of sideband to carrier power is displayed.

Amplitude Marker Resolution: log: 0.01 dB
linear: 4 digits

Plot

Controls HP-GL compatible digital plotters and raster graphics printers directly. Replicates display contents. "MARKER plot" allows marker position and amplitude to be annotated on plots at user defined locations.

General

Specifications apply when:
Warm-up time: None with AUTO-CAL enabled, or 30 minutes without AUTO-CAL enabled.
Within 5°C and 2 hrs of last internal calibration.
Ambient temperature: 0° to 55° C.
Relative Humidity: < 95% at 40° C.
Altitude: <4570m (15,000 ft.)

Storage: Temperature: −40° to +75° C.
Altitude: <15,240m (50,000 ft.)

Power: 100/120 VAC +5% − 10%, 48-440 Hz
220/240 VAC +5% − 10%, 48-66 Hz
150 VA maximum

Weight: 15 kg (33 lbs) net
21.6 kg (47.5 lbs) shipping

Dimensions: Without handle: 197mm (7.8") high
335mm (13.2") wide
595mm (23.4") deep

HP-IB: Implementation of IEEE Std 488-1978
SH1 AH1 T5 TEO L4 LEO SR1 RL1 PPO DC1 DT1 CO

Accessories Included: Front (bail) handle, pouch, front cover, Operating and Service manuals.

Accessories:
Transit case for 3561A: HP # 9211-2459
Rack Adapter for 3561A: HP #10491B, also requires fixed slides (1490-0714) or pivot slides (1490-0768).

1-10   RECOMMENDED TEST EQUIPMENT

The equipment required to maintain the -hp-3561A is listed in Table 1-5, Recommended Test Equipment. If the recommended model number is not available, a substitute can be used if it meets or exceeds the listed critical specifications. When substitutes are used, the user may have to modify the performance and adjustment procedures to accommodate the different operating characteristics of the substitute.

Figure 1-4 Series Resistor BNC Case

Resistance	Tolerance	Power	-hp- Part Number
1 k Ω	1%	.25 W	0757-0280
100 k Ω	1%	.25 W	0757-0465

Assembly

1. Cut resistor leads to 12mm on each end.

2. Solder one resistor lead to the center conductor
   of the BNC FEMALE connector.

3. Solder the CONDUCTOR CENTER PIN to the other
   lead of the resistor.

4. Screw the SLEEVE and the BNC MALE connector into
   place. Tighten securely.
1-11 STORAGE AND SHIPMENT

Environment

The -hp-3561A should be stored in a clean, dry environment. The following are environmental limitations that apply to both storage and shipment:

Temperature . . . .-40°C to +75°C
Humidity . . . . .Up to 95%
Altitude . . . . .Up to 15,300 meters (50,000 feet)

The instrument should also be protected from temperature extremes which cause condensation within the instrument.

Original Packaging

Containers and materials equivalent to those used in factory packaging are available through Hewlett-Packard offices. If the instrument is being returned to Hewlett-Packard for service, attach a tag indicating the type of service required, return address, model and full serial number.

Other Packaging

The following general instructions should be used for repackaging with commercially available materials:

1. Wrap the instrument with heavy paper or plastic.
2. Use a strong shipping container. A doublewall carton made of 350 pound test material is adequate.
3. Use a layer of shock absorbing material 70 to 100 mm (3 to 4 inches) thick around all sides of the instrument to provide firm cushioning and prevent movement inside of the container. Protect the control panel with cardboard.

{CAUTION}

Styrene pellets in any shape should never be used as packing material. The pellets do not adequately cushion or prevent the instrument from shifting in the carton. The pellets also create static electricity which can damage electronic components.

4. Seal the shipping container securely.
5. Mark the shipping container FRAGILE to ensure careful handling.
6. In any correspondence, refer to the instrument by model and full serial number.

SECTION II
PERFORMANCE TEST

SECTION II
PERFORMANCE TEST

2-1 INTRODUCTION

This section contains the procedures for the performance tests which will verify the 3561A's conformance to its published specifications listed in Table 1-4. A complete performance test consists of running the tests listed in paragraph 2-4, PERFOR- MANCE TEST SUMMARY, and requires approximately five hours to complete. If complete performance testing is not required, an operational verification can be per- formed. The operational verification does not verify conformance to published specifications, however, it does provide a high level of confidence regarding correct instrument operation. An operational verification consists of running all of the tests listed in paragraph 2-5, OPERATIONAL VERIFICATION SUMMARY, and requires ap- proximately one hour to complete.

For your convenience, a Performance Test Record card is provided at the end of this section to record the 3561A's performance test, or operational verification test results. This card can be removed from the manual and used as a permanent record of the test results. The Performance Test Record may be reproduced without the written permission of Hewlett-Packard.

2-2 CALIBRATION CYCLE

The -hp-3561A Dynamic Signal Analyzer requires a complete Performance Test every twelve months to verify conformance to its published specifications. The operational verification can be used as part of installation, incoming inspection, or after a repair to verify general operation.

2-1

2-3 REQUIRED TEST EQUIPMENT

The equipment required to test the -hp-3561A is listed in Table 1-5. If the recommended equipment is not available, a substitute, which meets or exceeds the "Required Characteristics" given in the table, may be used. When substitutions are made the user may have to modify the performance test procedures to accommodate the different operating characteristics of the substitute. The equipment required for each test is listed at the beginning of each individual test section.

When the recommended test equipment of Table 1-5 is used to complete the performance tests, the instruments listed below must be set to the preset conditions listed before beginning the tests. If any equipment parameters are not specified in the individual test, the unspecified parameter should be set to the condition listed below.

2-2

2-4 PERFORMANCE TEST SUMMARY

The tests listed in Table 2-1 must be completed to verify that the -hp-3561A meets its published specifications. Because some tests depend on previous test results, the tests must be performed in the order listed. No warm up time is required. If any of the tests fail, the -hp-3561A must be either repaired or adjusted. The "What if the Test Fails" column of Table 2-1 indicates the troublshooting procedures or adjustments most likely to correct the failure.

Table 2-1 Performance Test Summary

2-5 OPERATIONAL VERIFICATION SUMMARY †

The tests listed in Table 2-2 comprise the operational verification. To minimize the time required to change instrument configurations between tests, run the tests in the order shown. No warm up time is required.

†   All tests marked with a † next to the paragraph title are part of the operational verification. The operational verification is a subset of the performance test. When performing an operational verification, complete only the measurements and procedure steps marked with a †. The Performance Test Record can be used to record the operational verification results. All measurements required for the operational verification are marked with a † on the Performance Test Record.

Table 2-2 Operational Verification Summary

Paragraph Number	Test Name
2-6	dc Offset
2-7	Amplitude Accuracy/Flatness
2-9	Noise Level/Spurious Signal Level
2-10	Frequency Accuracy
2-14	Phase Accuracy
2-20	Noise Source Amplitude Accuracy/Flatness
2-22	Internal Self Test

2-6   dc Offset †

This test measures the level of the dc offset generated within the -hp-3561A when the auto-zero circuit is enabled.

SPECIFICATION

For range settings between +27 dBV and -35 dBV, the dc offset will be greater than 30 dB below the range setting; for range setting less than -35 dBV, the dc offset will be greater than 20 dB below the range setting.

REQUIRED TEST EQUIPMENT

    none

PROCEDURE

† 1. Set the -hp-3561A controls as follows:

```
PRESET
RANGE . . . . . . . . . .    DEFINE RANGE . . . . . . . . . . . . . . . . . .0 dBV
FORMAT . . . . . . . .    SINGLE
AVeraGe . . . . . . . .    DEFINE NUM
                           AVGS . . . . . . . . . . . . . . . . . . . . . . . . .4 ENTER
                           RMS
INPUT . . . . . . . . . .    SINGLE CAL
```

† 2. When the calibration is complete, press the -hp-3561A START key to initiate a measurement.

† 3. When the average is complete, move the marker to 0 Hz and record the the marker amplitude (Y:) reading on the Performance Test Record.

† 4. Set the -hp-3561A controls as follows:

    RANGE . . . .   DEFINE RANGE . . . . -25 dBV

† 5. Repeat steps 2 and 3.

† 6. Set the -hp-3561A controls as follows:

    RANGE . . . .   DEFINE RANGE . . . . -51 dBV

† 7. Repeat steps 2 and 3.

2-7 Amplitude Accuracy/Flatness †

This test measures the amplitude accuracy of the -hp-3561A against the amplitude reference of the ac calibrator. To insure that the ac calibrator output is set to the center of an -hp-3561A measurement bin, the ac calibrator is frequency locked to the frequency synthesizer. The amplitude accuracy is measured at each of the points listed in Table 2-3.

Table 2-3 Amplitude Accuracy/Flatness Measurement

Signal Frequency	Range Setting	ac Calibrator Amplitude	Tolerance
† 1 kHz	8 dBV	(2.5119 Vrms)	± .15 dB
† 99 kHz	8 dBV	(2.5119 Vrms)	± .15 dB
† 1 kHz	-11 dBV	(.28184 Vrms)	± .15 dB
† 99 kHz	-11 dBV	(.28184 Vrms)	± .15 dB
1 kHz	-22 dBV	(79.433 mVrms)	± .15 dB
50 kHz	-22 dBV	(79.433 mVrms)	± .15 dB
90 kHz	-22 dBV	(79.433 mVrms)	± .15 dB
100 kHz	-22 dBV	(79.433 mVrms)	± .15 dB
1 kHz	-51 dBV	(2.8184 mVrms)	± .25 dB
1 kHz	-49 dBV	(3.5481 mVrms)	± .25 dB
1 kHz	-47 dBV	(4.4668 mVrms)	± .25 dB
1 kHz	-45 dBV	(5.6234 mVrms)	± .25 dB
1 kHz	-43 dBV	(7.0795 mVrms)	± .25 dB
1 kHz	-41 dBV	(8.9125 mVrms)	± .25 dB
1 kHz	-39 dBV	(11.220 mVrms)	± .15 dB
1 kHz	-29 dBV	(35.481 mVrms)	± .15 dB
1 kHz	-27 dBV	(44.668 mVrms)	± .15 dB
1 kHz	-25 dBV	(56.234 mVrms)	± .15 dB

† When performing an operational verification rather than a full performance test, complete these measurements only.

2-5

Specification

For an input sine wave with an amplitude equal to the range setting, the marker amplitude reading will not deviate from the actual signal amplitude by more than:

Range Setting	Accuracy
+23 dBV to -39 dBV	.15 dB (1.74%)
-40 dBV to -51 dBV	.25 dB (2.92%)

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . . -hp-3325A
AC Calibrator . . . . FLUKE 5200A

INITIAL TEST SETUP

Figure 2-1 Amplitude Accuracy/Flatness Test Setup
PROCEDURE

† 1.   Connect the test instruments as shown in Figure 2-1 and set the instrument
       controls as follows:

       Frequency Synthesizer

       Function . . . .   Square Wave
       Frequency . . . .   1 kHz
       Amplitude . . . .   1 Vrms

       AC Calibrator

       Frequency . . . .   1 kHz
       Amplitude . . . .   2.5119 Vrms (8 dBV)
       Phase Lock . . . . . .   ON
       Sense . . . .   INTERNAL
       Mode . . . .   OPER

       -hp-3561A

       PRESET
       RANGE . . . .   DEFINE RANGE . . . . .8 dBV
       FORMAT . . . .   SINGLE
       AVeraGe . . . .   RMS
                                 DEFINE NUM
                                 AVGS . . . . .4 ENTER
       INPUT . . . .   SINGLE CAL

† 2.   When the calibration is complete, press the -hp-3561A START key to initiate
       measurement.

† 3.   When the average is complete, move the marker to 1 kHz and record the
       marker amplitude (Y:) reading on the Performance Test Record.

† 4.   Set the ac calibrator controls as follows:
       Frequency 99 kHz

† 5.   Set the frequency synthesizer controls as follows:

       Frequency . . . . .99 kHz

† 6.   Press the -hp-3561A START key to initiate a measurement.

† 7.   When the average is complete, move the marker to 99 kHz and record the
       marker amplitude (Y:) reading on the Performance Test Record.

† 8.   Set the ac calibrator controls as follows:
       Frequency . . . . .1 kHz
       Amplitude . . . . 2 8184 Vrms (-11 dBV)

† 9. Set the frequency synthesizer controls as follows:

    Frequency . . . . .1 kHz

† 10. Set the -hp-3561A controls as follows:

    RANGE . . . .   DEFINE RANGE . . . .-11 dBV

† 11. Press the -hp-3561A START key to initiate a measurement.

† 12. When the average is complete, move the marker to 1 kHz and record the
      marker amplitude (Y:) reading on the Performance Test Record.

† 13. Repeat steps 8 through 12 for each of the remaining measurements listed in
      Table 2-3. For each measurement, set the ac calibrator and the frequency syn-
      thesizer to the signal frequency listed in the Table. Set the -hp-3561A range set-
      ting and the ac calibrator amplitude to the corresponding values listed. Record
      the marker amplitude (Y:) reading on the Performance Test Record for each
      measurement.

2-8 Amplitude Linearity

This test measures the amplitude linearity of the -hp-3561A against the amplitude
reference of the ac calibrator. The ac calibrator is used to input a signal to the
-hp-3561A at each of the amplitudes listed in Table 2-4. All values of Table 2-4 are
measured at frequencies of 1 kHz and 99 kHz.

Table 2-4 Amplitude Linearity Measurement

Amplitude	
Vrms	(dBV)
10.0 Vrms	(+20 dBV)
1.00 Vrms	(+0 dBV)
100.0 mVrms	(-20 dBV)
10.0 mVrms	(-40 dBV)
3.1623 mVrms	(-50 dBV)
1.00 mVrms	(-60 dBV)

SPECIFICATION

The marker amplitude reading will not deviate from the actual signal amplitude by
more than:

Range Setting   Accuracy
+23 dBV to -40 dBV   .15 dB ± .015 % of Range Setting
-41 dBV to -51 dBV   .25 dB ± .025 % of Range Setting

INPUT. . . . .   SINGLE CAL

2.   When the calibration is complete, press the -hp-3561A START key to initiate a
     measurement.

3.   When the average is complete, move the marker to 1 kHz and record the
     marker amplitude (Y:) reading on the Performance Test Record.

4.   Set the ac calibrator controls as follows:

     Amplitude . . . .   1.00 Vrms

5.   Press the -hp-3561A START key to initiate a measurement.

6.   When the average is complete, record the marker amplitude (Y:) reading on the
     Performance Test Record.

7.   Repeat steps 4 through 6, for the remaining ac calibrator amplitudes listed in
     Table 2-4. Record the marker amplitude (Y:) reading for each of the amplitude
     settings in the corresponding position of the Performance Test Record.

8.   Set the ac calibrator controls as follows:

     Frequency . . . .   99 kHz
     Amplitude . . . .   10 Vrms

9.   Set the frequency synthesizer controls as follows:

     Frequency . . . .   99 kHz

10. Set the -hp-3561A controls as follows:

    FREQuency . . . .   DEFINE SPAN . . . . 100 kHz

11. Set the ac calibrator controls as follows:

    Amplitude . . . .   10 Vrms

12. Press the -hp-3561A START key to initiate a measurement.

13. When the average is complete, move the marker to 99 kHz, and record the marker amplitude (Y:) reading on the Performance Test Record.

14. Repeat steps 11 through 13, for the remaining ac calibrator amplitudes listed in Table 2-4. Record the marker amplitude (Y:) reading for each of the amplitude settings in the corresponding position of the Performance Test Record.

2-9 Noise Level/Spurious Signal Level †

This test measures the level of the noise floor and any spurious signals generated within the -hp-3561A. The input is terminated with a 50 Ω load, and the noise level or spurious signal level is read from the display marker in each of the measurements listed in Table 2-5. In all measurements both the noise level and discrete signals should be below the value given on the Performance Test Record.

Table 2-5 Noise Level/Spurious Signal Measurement

Start Frequency	Frequency Span	Window / Bandwidth	Noise Level
20 Hz	2 kHz	Uniform / 5.0 Hz	≤ -131 dBV
2 kHz	25 kHz	Uniform / 62.5 Hz	≤ -131 dBV
25 kHz	25 kHz	Uniform / 62.5 Hz	≤ -131 dBV
50 kHz	25 kHz	Uniform / 62.5 Hz	≤ -131 dBV
75 kHz	25 kHz	Uniform / 62.5 Hz	≤ -131 dBV
† 20 Hz	1 kHz	Flat Top / 9.5475 Hz	≤ -131 dBV
† 2 kHz	100 kHz	Flat Top / 954.75 Hz	≤ -120 dBV

† When performing an operational verification rather than a full performance test, complete these measurements only.

SPECIFICATION

When the input is terminated with a 50 Ω load, the amplitude of all spurious signals will be greater than 80 dB below the range setting and the average noise level will be less than:

Frequency   Noise Level
2 kHz to 100 kHz   -150 dBV/$\sqrt{Hz}$ (-120 dBV for a 955 Hz Bandwidth)
20 Hz to   1 kHz   -141 dBV/$\sqrt{Hz}$ (-131 dBV for a 9.55 Hz Bandwidth)

	AVGS	20 ENTER
INPUT.	SINGLE CAL	

2.   When the calibration is complete, press the -hp-3561A START key to initiate a measurement.

3.   When the average is complete, set the -hp-3561A controls as follows:

MarKeR . . . .   MKR — > PEAK

4.   Record the marker amplitude (Y:) reading on the Performance Test Record.

5.   Set the -hp-3561A controls as follows:

FREQuency . . . . . .   DEFINE SPAN . . . . .25 kHz
                        DEFINE START . . . . .2 kHz

6.   Repeat steps 2 through 4.

7.   Set the -hp-3561A start frequency to 25 kHz, 50 kHz, and 75 kHz. For each start frequency, repeat steps 2 through 4 to measure the peak signal level. For each measurement, record the marker amplitude (Y:) reading in the corresponding position of the Performance Test Record.

8.   Set the -hp-3561A controls as follows:

FREQuency . . . . . .   DEFINE SPAN . . . . .1 kHz
                        DEFINE START . . . . .20 Hz
WINDOW . . . .   FLAT TOP

9.   Repeat steps 2 through 4.

10.   Set the -hp-3561A controls as follows:

FREQuency . . . . . .   DEFINE SPAN . . . . .100 kHz
                        DEFINE START . . . . .2 kHz

11.   Repeat steps 2 through 4.

2-10 Frequency Accuracy †

This test measures the frequency accuracy of the -hp-3561A against the frequency reference of the frequency synthesizer. Complete the entire test for both a performance test and an operational verification.

SPECIFICATION

The frequency reading will not deviate from the actual signal frequency by more than .003 % (equivalent to ± 3 Hz at 100 kHz).

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . . -hp-3325A
50 Ω Termination. . . . . -hp-11048C

INITIAL TEST SETUP

Figure 2-4 Frequency Accuracy Test Setup
PROCEDURE

† 1. Connect the test instruments as shown in Figure 2-4 and set the instrument controls as follows:

Frequency Synthesizer

Frequency . . . .   99.99 kHz
Amplitude . . . .   1 Vrms (0 dBV)

-hp-3561A

PRESET
RANGE . . . .   DEFINE RANGE . . . . .0 dBV
FORMAT . . . .   SINGLE
FREQuency . . . . . .   DEFINE SPAN . . . . .100 Hz
                         DEFINE CENTER. . . . . .99.99 kHz
WINDOW . . . .   UNIFORM
INPUT. . . . .   SINGLE CAL

† 2. When the calibration is complete, set the -hp-3561A controls as follows:

   MarKeR . . . .   MKR — > PEAK

† 3. Record the marker frequency (X:) reading on the Performance Test Record.

2-11 Input Coupling Insertion Loss

This test measures the insertion loss at 1 Hz due to the ac coupling capacitor. The amplitude of a 1 Hz signal from the frequency synthesizer is measured in both the ac and dc coupled modes. The insertion loss is then calculated as:

   dc Coupled Amplitude - ac Coupled Amplitude = Insertion Loss

SPECIFICATION

The insertion loss at 1 Hz due to the ac coupling capacitor will be less than 3 dB.

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . .-hp-3325A
50 Ω Termination. . . . .-hp-11048C

INITIAL TEST SETUP

Figure 2-5 Input Coupling Insertion Loss Test Setup
PROCEDURE

1.   Connect the test instruments as shown in Figure 2-5 and set the instrument controls as follows:

Frequency Synthesizer

Frequency . . . .   1 Hz
Amplitude . . . .   1 Vrms (0 dBV)

-hp-3561A

PRESET
FORMAT . . . .   SINGLE
RANGE . . . .   DEFINE RANGE . . . . .0 dBV
FREQuency . . . . . .   DEFINE SPAN . . . . .100 Hz
INPUT. . . . .   SINGLE CAL

2.   When the calibration is complete, move the marker to 1 Hz and set the -hp-3561A controls as follows:

RELative MarKeR .   REL MKR ON
                    MKR — > REF
INPUT. . . . .   COUPLE AC

3.   When the measurement is complete, record the marker relative amplitude (Yr:) reading as the insertion loss value on the Performance Test Record.

2-12 Anti-Alias filter Response

This test measures the response of the 100 kHz low pass anti-alias filter. All measurements are made relative to the filter attenuation of a signal with a 100 kHz actual frequency. Due to internal sampling at a 256 kHz rate, signals with frequencies greater than 156 kHz may be shifted down (aliased) into the 100 kHz frequency range of the -hp-3561A. The signal frequencies listed in Table 2-6 will be shifted to the corresponding alias frequencies listed in the table.

NOTE
Some spurious signals due to the -hp-3325A may show up in the
0 - 100 kHz span of the -hp-3561A. Ignore signals at frequencies
other than those listed in Table 2-6 when performing this test.

Table 2-6 Anti-Alias Filter Response Measurement

Signal Frequency	Alias Frequency
156 kHz	100 kHz
185 kHz	71 kHz
206 kHz	50 kHz
267 kHz	11 kHz
924 kHz	100 kHz

SPECIFICATION
All signals aliased into the 0 - 100 kHz frequency span will be attenuated to more than 80 dB below the range setting.

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . . -hp-3325A
50 Ω Termination. . . . . -hp-11048C

INITIAL TEST SETUP

Figure 2-6 Anti-Alias Filter Test Setup

PROCEDURE

1. Connect the test instruments as shown in Figure 2-6 and set the instrument controls as follows:

    Frequency Synthesizer

Frequency	100 kHz
Amplitude	1 Vrms (0 dBV)

    -hp-3561A

PRESET	
RANGE	DEFINE RANGE ... .0 dBV
FORMAT	SINGLE
AVeraGe	DEFINE NUM
	AVGS ....20 ENTER
	RMS
INPUT...........	SINGLE CAL

2. When the calibration is complete, press the -hp-3561A START key to initiate a measurement.

3. When the average is complete, move the marker to 100 kHz and set the -hp-3561A controls as follows:

RELative MarKeR .	REL MKR ON
	DEFINE MAG REF ... .MKR VALUE
VERTical SCALE ..	DEFINE FULL SCL ....-20 dBV

2-18

4. Set the frequency synthesizer controls as follows:

    Frequency . . . . 156 kHz

5. Press the -hp-3561A START key to initiate a measurement.

6. When the average is complete, move the marker to 100 kHz and record the
    marker relative amplitude (Yr:) on the Performance Test Record.

7. Repeat steps 4 through 6, setting the frequency synthesizer to each of the fre-
    quencies listed in the signal frequency column of Table 2-6. For each frequency
    setting, move the marker to the corresponding frequency listed in the alias fre-
    quency column of Table 2-6. Record the marker relative amplitude (Yr:) reading
    in the corresponding position of the Performance Test Record for each
    measurement.

2-13 A-Weight Filter Response

This test measures the filter shape of the -hp-3561A's internal A-Weight Filter. The
frequency synthesizer is used to input a sine wave at each of the frequencies listed
in Table 2-7. The A-Weight filter is switched into the main signal path to compensate
for the frequency response of the human ear when making acoustic measurements.

Table 2-7 A-Weight Filter Response Measurement

Frequency	Amplitude	Tolerance
10 Hz	-70.4 dB	± 4 dB
80 Hz	-22.5 dB	± 1 dB
400 Hz	-4.8 dB	± 1 dB
1000 Hz	0 dB	± 1 dB
2500 Hz	1.3 dB	± 1 dB
5000 Hz	0.5 dB	+1, -2 dB
20000 Hz	-9.3 dB	+3, -∞ dB

SPECIFICATIONS

The A-Weight filter will conform to ANSI Standard SI.4-1971 (1976) for Type 1
A-Weight Filter.

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . .-hp-3325A
50 Ω Termination . . . .-hp-11048C

INITIAL TEST SETUP

Figure 2-7 A-Weight Filter Response Test Setup
PROCEDURE

1. Connect the test instruments as shown in Figure 2-7 and set the instrument con-
    trols as follows:

    Frequency Synthesizer

    Frequency . . . .   1 kHz
    Amplitude . . . .   1 Vrms (0 dBV)

    -hp-3561A

    PRESET
    RANGE . . . .   DEFINE RANGE . . . . .5 dBV
    FORMAT . . . .   SINGLE
    FREQuency . . . . . .   DEFINE SPAN . . . . .2 kHz
    AVeraGe . . . .   RMS
                              DEFINE NUM
                              AVGS . . . . .4 ENTER
    INPUT. . . . .   SINGLE CAL

2. When the calibration is complete, press the -hp-3561A START key to initiate a
    measurement.

3. When the average is complete, move the marker to 1 kHz and set the -hp-3561A controls as follows:

    RELative MarKeR . REL MKR ON
                       DEFINE MAG REF   ....MKR VALUE
    INPUT........... A WT FLT ON
    FREQuency ...... DEFINE SPAN ....400 Hz

4. Set the frequency synthesizer controls as follows:

    Frequency .... 10 Hz

5. Press the -hp-3561A START key to initiate a measurement.

6. When the average is complete, move the marker to 10 Hz and record the marker relative amplitude (Yr:) reading on the Performance Test Record.

7. Repeat steps 4 through 6, setting the frequency synthesizer and and the marker to 80 Hz and 400 Hz. Record the marker relative amplitude (Yr:) reading for each frequency in the corresponding Position of the Performance Test Record

8. Set the -hp-3561A controls as follows:

    FREQuency ...... DEFINE SPAN ....50 kHz

9. Repeat steps 4 through 6, setting the frequency synthesizer and and the marker to each of the remaining frequencies listed in Table 2-7. Record the marker relative amplitude (Yr:) reading for each frequency in the corresponding position of the Performance Test Record.

2-14 Phase Accuracy †

This test measures the phase accuracy of the -hp-3561A. The frequency synthesizer is used to input a square wave to the -hp-3561A signal input and external trigger input. All phase measurements are made relative to the phase of the trigger signal.

Table 2-8 Phase Accuracy Measurement

	Frequency	Slope	Trigger Type
†	99 kHz	POS	INPUT
†	99 kHz	POS	EXTERNAL
	99 kHz	NEG	INPUT
	99 kHz	NEG	EXTERNAL
	9 kHz	POS	INPUT
	9 kHz	POS	EXTERNAL

† When performing an operational verification rather than a full performance test, complete these measurements only.

2-21

SPECIFICATION

The marker phase reading will not deviate from the actual phase of the signal relative to the trigger by more than:

Frequency Range	Phase Deviation
0 - 10 kHz	$\leq$ 2 deg
10 kHz - 100 kHz	$\leq$ 10 deg

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . . -hp-3325A
50 Ω Termination . . . . -hp-11048C

INITIAL TEST SETUP

                      TRIGGER

† 6. Press the -hp-3561A START key to initiate a measurement.

† 7. When the average is complete, move the marker to 99 kHz and record the marker phase (Y:) reading on the Performance Test Record.

8.   Set the -hp-3561A controls as follows:

TRIGger SELect. . .   SETUP SELECT . . .SLOPE NEG

9.   Repeat Steps 2 through 7.

10. Set the frequency synthesizer controls as follows:

   Frequency .... 9 kHz

11. Set the -hp-3561A controls as follows:

   TRIGger SELect... SETUP SELECT ...SLOPE POS

12. Repeat steps 2 through 7, setting the marker to 9 kHz. Record the marker phase (Y:) reading in the corresponding 9 kHz position of the Performance Test Record.

2-15 Input Impedance

This test measures the input impedance of the -hp-3561A as a parallel resistance (R) and capacitance (C). The digital voltmeter is used to measure the input resistance directly. The input capacitance is then measured by inputting a 100 kHz signal from the frequency synthesizer. The equations used to calculate the capacitance are given on the Performance Test Record.

SPECIFICATION

Input Resistance (R) = 1 MΩ ± 50 kΩ (5%)
Input Capacitance (C) ≤ 95 pf

REQUIRED TEST EQUIPMENT

Frequency Synthesizer ....-hp-3325A
Digital Voltmeter ....-hp-3455A
100 kΩ Resistor 1% ....see Figure 1-4

    Ground Switch . . . CHASSIS

2. Record the digital voltmeter reading on the Performance Test Record.

3. Set the -hp-3561A controls as follows:

    RANGE . . . . DEFINE RANGE . . . . .0 dBV

2-25

4.   Record the digital voltmeter reading on the Performance Test Record.

5.   Set the -hp-3561A controls as follows:

   RANGE . . . .   DEFINE RANGE . . . .-13 dBV

6.   Record the digital voltmeter reading on the Performance Test Record.

7.   Connect the test instruments as shown in Figure 2-10.

Figure 2-10 Input Capacitance Test Setup
8.   Set the frequency synthesizer controls as follows:

   Frequency . . . .   100 kHz
   Amplitude . . . .   1 Vrms (0 dBV)

9.   Set the -hp-3561A controls as follows:

   PRESET
   RANGE . . . .   DEFINE RANGE . . . . .1 Vrms
   FORMAT . . . .   SINGLE
   INPUT . . . .   SINGLE CAL

10.   When the calibration is complete, move the marker to 100 kHz and record the
      marker amplitude (Y:) reading in the V1 position of the Performance Test
      Record.

11.   Remove the 100 kΩ resistor from the signal path and connect the BNC cable
      with the 50 Ω termination directly to -hp-3561A input connector.

12.   Record the marker amplitude (Y:) reading in the V2 position of the Performance
      Test Record.

13. Use the equations given on the Performance Test Record to calculate the capacitance.

2-16 Floating Ground Capacitance

This test measures the capacitance between the floating ground and the chassis ground when the front panel ground switch is in the FLOAT position. The equations used to calculate the capacitance are given on the Performance Test Record.

SPECIFICATION

The capacitance between the floating ground and the chassis ground will be less than or equal to .25 μf.

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . .-hp-3325A
50 Ω Termination. . . . .-hp-11048C
600 Ω Termination . . . .-hp-11095A

INITIAL TEST SETUP

Figure 2-11 Floating Ground Capacitance Test Setup
PROCEDURE

1. Connect the test instruments as shown in Figure 2-11 and set the instrument controls as follows:

    Frequency Synthesizer

    Frequency .... 1 kHz
    Amplitude .... 1 Vrms (0 dBV)

    -hp-3561A

    PRESET
    RANGE .... DEFINE RANGE .... 1 Vrms
    FREQuency ...... DEFINE SPAN .... 10 kHz
    FORMAT .... SINGLE
    Ground Switch ... CHASSIS
    INPUT .... SINGLE CAL

2-28

2. When the calibration is complete, move the marker to 1 kHz. Record the marker amplitude (Y:) reading in the V1 position of the Performance Test Record.

3. Set the -hp-3561A controls as follows:

    Ground Switch ... FLOAT

4. Record the marker amplitude (Y:) reading in the V2 position of the Performance Test Record.

5. Use the equations given on the Performance Test Record to calculate the capacitance.

2-17 Harmonic Distortion

This test measures the harmonic distortion generated in the -hp-3561A. In the first measurement, a low noise oscillator is used to input a sinewave at a frequency of 99 kHz $\div$ N (for N equal to 2, 3, 4, and 5). The amplitude of the Nth harmonic is measured at 99 kHz on the -hp-3561A display. In the second measurement, the low noise oscillator is used to input a sinewave at 1 kHz. The first five harmonics generated within the -hp-3561A are then measured on the -hp-3561A display.

Table 2-9 Harmonic Frequencies Measurement One

Signal Frequency	Harmonic Number	Harmonic Frequency
49500 Hz	2nd	99 kHz
33000 Hz	3rd	99 kHz
24750 Hz	4th	99 kHz
19800 Hz	5th	99 kHz

Table 2-10 Harmonic Frequencies Measurement Two

Signal Frequency	Harmonic Number	Harmonic Frequency
1 kHz	2nd	2 kHz
1 kHz	3rd	3 kHz
1 kHz	4th	4 kHz
1 kHz	5th	5 kHz
1 kHz	6th	6 kHz

SPECIFICATION

The relative amplitude of all harmonics will be greater than 80 dB below the amplitude of the fundamental.

REQUIRED TEST EQUIPMENT

Low Distortion Oscillator . . . .-hp-339A
600 Ω Termination . . . .-hp-11095A

2-29

INITIAL TEST SETUP

Figure 2-12 Harmonic Distortion Test Setup
PROCEDURE

1. Connect the test instruments as shown in Figure 2-12 and set the instrument controls as follows:

   Low Noise Oscillator

   Frequency . . . .   49 kHz
   Amplitude . . . .   1 Vrms

   -hp-3561A

   PRESET
   FORMAT . . . .   SINGLE
   RANGE . . . .   DEFINE RANGE . . . . .0 dBV
   FREQuency . . . . . .   DEFINE CENTER. . . . . .49.5 kHz
                            DEFINE SPAN . . . . .10 kHz
   INPUT. . . . .   SINGLE CAL

2. When the calibration is complete, move the marker to 49.5 kHz. Adjust the low noise oscillator frequency vernier for a 49.5 kHz sine wave output. Adjust the low noise oscillator amplitude vernier for a marker amplitude reading of between -2 dBV and 0 dBV.

3. Set the -hp-3561A controls as follows:

   RELative MarKeR .   REL MKR ON
                       DEFINE MAG REF . . . . .MKR VALUE
   FREQuency . . . . . .   DEFINE CENTER. . . . . .99 kHz
   VERTical SCALE . .   DEFINE FULL SCL . . . .-20 dBV
   AVeraGe . . . .   DEFINE NUM
                             AVGS . . . . .20 ENTER
                             RMS

4. Press the -hp-3561A START key to initiate a measurement.

5. When the average is complete, move the marker to 99 kHz and record the marker relative amplitude (Yr:) reading on the Performance Test Record.

6. Set the -hp-3561A controls as follows:

    AVeraGe ....   OFF

7. Set the low noise oscillator controls as follows:

    Frequency ....   32 kHz

8. Set the -hp-3561A controls as follows:

    FREQuency ......   DEFINE CENTER.. ....33 kHz
    VERTical SCALE ..   DEFINE FULL SCL ....0 dBV

9. Move the marker to 33 kHz. Adjust the low noise oscillator frequency vernier for a frequency of 33 kHz.

10. Repeat steps 3 through 6.

11. Set the low noise oscillator controls as follows:

    Frequency ....   24 kHz

12. Set the -hp-3561A controls as follows:

    FREQuency ......   DEFINE CENTER.. ....24.75 kHz
    VERTical SCALE ..   DEFINE FULL SCL ....0 dBV

13. Move the marker to 24.75 kHz. Adjust the low noise oscillator frequency vernier for a frequency of 24.75 kHz.

14. Repeat steps 3 through 6.

15. Set the low noise oscillator controls as follows:

    FREQUENCY .....   19 kHz

16. Set the -hp-3561A controls as follows:

    FREQuency ......   DEFINE CENTER.. ....19.8 kHz
    VERTical SCALE ..   DEFINE FULL SCL ....0 dBV

17. Move the marker to 19.8 kHz. Adjust the low noise oscillator frequency vernier for a frequency of 19.8 kHz.

18. Repeat steps 3 through 6. 19. Set the low noise oscillator as follows:

    Frequency ....   990 Hz

20. Set the -hp-3561A as follows:

    FREQuency ......   DEFINE SPAN ....10 kHz
                         DEFINE START ... .0 Hz
    VERTical SCALE ..   DEFINE FULL SCL ....0 dBV

21. Move the marker to 1 kHz. Adjust the low noise oscillator frequency vernier for a frequency of 1 kHz.

22. Set the -hp-3561A controls as follows:

RELative MarKeR .   REL MKR ON
                     DEFINE MAG REF .... MKR VALUE
VERTical SCALE ..   DEFINE FULL SCL .... -20 dBV
AVeraGe ....   DEFINE NUM
                     AVGS .... .20 ENTER
                     RMS

23. Press the -hp-3561A START key to initiate a measurement.

24. When the average is complete, move the marker to each of the harmonic frequencies listed in Table 2-10. Record the marker relative amplitude (Yr:) reading for each harmonic on the Performance Test Record.

2-18 Two-Tone Intermodulation Distortion

This test measures the level of the intermodulation distortion products generated within the -hp-3561A out to the 4th order. The outputs of the frequency synthesizer and the low noise oscillator are summed together through two 1 kΩ resistors.

Table 2-11 Intermodulation Products Measurement One

Fundamental Frequencies		Intermodulation Distortion	
F1	F2	Order	Frequency
25 kHz	30 kHz	F2 - F1	5 kHz
25 kHz	30 kHz	2F1 - F2	20 kHz
25 kHz	30 kHz	2F2 - 2F1	10 kHz
25 kHz	30 kHz	3F1 - 2F2	15 kHz

Table 2-12 Intermodulation Products Measurement Two

Fundamental Frequencies		Intermodulation Distortion	
F1	F2	Order	Frequency
95 kHz	100 kHz	F2 - F1	5 kHz
95 kHz	100 kHz	2F1 - F2	90 kHz
95 kHz	100 kHz	2F2 - 2F1	10 kHz
95 kHz	100 kHz	3F1 - 2F2	85 kHz

SPECIFICATION

The amplitude of all intermodulation products will be greater than 80 dB below the fundamental amplitude.

REQUIRED TEST EQUIPMENT

Frequency Synthesizer . . . . -hp-3325A
Low Noise Oscillator . . . . -hp-339A
(2) 50 Ω Terminations . . . . -hp-11048C
(2) 1 kΩ Series Resistors . . . . see Figure 1-6

INITIAL TEST SETUP

Figure 2-13 Intermodulation Distortion Test Setup

PROCEDURE

1. Connect the test instruments as shown in Figure 2-13 and set the instrument controls as follows:

   Frequency Synthesizer

   Frequency . . . . 30 kHz
   Amplitude . . . . 100 mVrms (-20 dBV)

   Low Noise Oscillator

   Frequency . . . . 24 kHz
   Amplitude . . . . 1 V

   -hp-3561A

   PRESET
   RANGE . . . .   DEFINE RANGE . . . . -19 dBV
   FREQuency . . . . . .   DEFINE CENTER . . . . 30 kHz
                            DEFINE SPAN . . . . 5 kHz
   FORMAT . . . .   SINGLE
   INPUT . . . .   SINGLE CAL

2. When the calibration is complete, move the marker to 30 kHz and set the -hp-3561A as follows:

   RELative MarKeR .   REL MKR ON
                        DEFINE MAG REF . . . . MKR VALUE
   FREQuency . . . . . .   DEFINE CENTER . . . . 25 kHz

3. Adjust the low noise oscillator frequency vernier for a frequency of 25 kHz. Adjust the low noise oscillator amplitude until the marker relative amplitude (Yr:) reading is 0 dB ± .5 dB at 25 kHz.

4. Set the -hp-3561A controls as follows:

   AVeraGe . . . .   RMS
                            DEFINE NUM
                            AVGS . . . . 20 ENTER
   VERTical SCALE . .   DEFINE FULL SCL . . . . -40 dBV

5. Set the -hp-3561A controls as follows:

   FREQuency . . . . . .   DEFINE CENTER . . . . 5 kHz

6. Press the -hp-3561A START key to initiate a measurement.

7. When the average is complete, move the marker to 5 kHz. Record the marker relative amplitude (Yr:) reading on the Performance Test Record.

2-34

8. Repeat steps 5 through 7 for each of the remaining intermodulation distortion frequencies listed in Table 2-11. For each frequency record the marker relative amplitude (Yr:) reading on the corresponding position of the Performance Test Record.

9. Set the frequency synthesizer controls as follows:

    Frequency . . . .   100 kHz

10. Set the low noise oscillator controls as follows:

    Frequency . . . .   94 kHz

11. Set the -hp-3561A controls as follows:

    AVeraGe . . . .   OFF
    FREQuency . . . . .   DEFINE CENTER. . . . . .100 kHz
    VERTical SCALE . .   DEFINE FULL SCL . . . .-19 dBV

12. Move the marker to 100 kHz and set the -hp-3561A as follows:

    RELative MarKeR .   REL MKR ON
                        DEFINE MAG REF . . . . .MKR VALUE
    FREQuency . . . . . .   DEFINE CENTER. . . . . .95 kHz

13. Adjust the low noise oscillator frequency vernier for a frequency of 95 kHz. Adjust the low noise oscillator amplitude until the marker amplitude offset is 0 dB ± .5 dB at 95 kHz.

14. Set the -hp-3561A controls as follows:

    VERTical SCALE . .   DEFINE FULL SCL . . . .-40 dBV
    AVeraGe . . . .   RMS
                        DEFINE NUM
                        AVGS . . . . .20 ENTER

15. Set the -hp-3561A controls as follows:

    FREQuency . . . . . .   DEFINE CENTER. . . . . .5 kHz

16. Press the -hp-3561A START key to initiate a measurement.

17. When the average is complete, move the marker to 5 kHz. Record the marker relative amplitude (Yr:) reading on the Performance Test Record.

18. Repeat steps 15 through 17 for each of the remaining intermodulation distortion frequencies listed in Table 2-12. For each frequency record the marker relative amplitude (Yr:) reading on the corresponding position of the Performance Test Record.

2-35

2-19 Noise Source Output Impedance

This test uses the -hp-3561A input channel to measure the output level of the noise source with and without a 50 Ω termination on the source output. From these two measurements the noise source output impedance is calculated.

SPECIFICATION

The noise source output impedance will be 50 Ω ± 5 Ω (10%)

REQUIRED TEST EQUIPMENT

50 Ω Termination . . . . -hp-11048C

INITIAL TEST SETUP

Figure 2-14 Noise Source Impedance Test Setup

NOISE

Rear Panel View
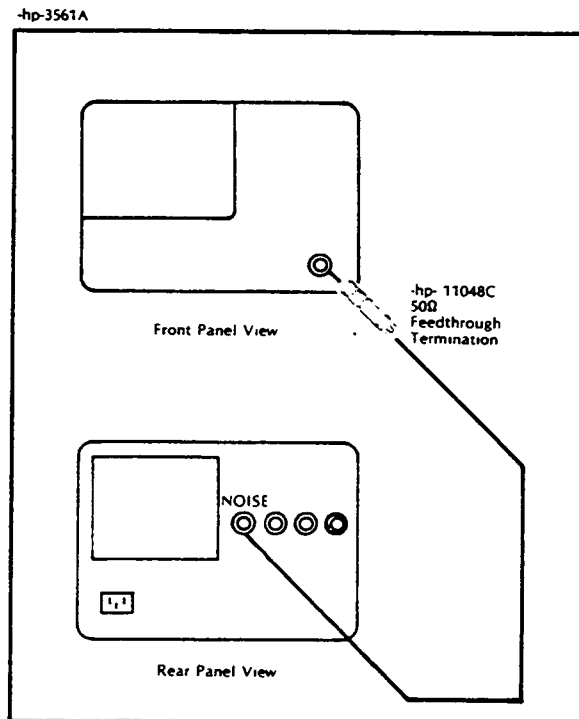

PROCEDURE

1. Connect the test instruments as shown in Figure 2-14 and set the instrument controls as follows:

    -hp-3561A

    PRESET
    RANGE . . . .   DEFINE RANGE . . . . .3.5 Vrms
    FORMAT . . . .   SINGLE
    WINDOW . . . .   UNIFORM
    AVeraGe . . . .   DEFINE NUM
                                AVGS . . . . .10 ENTER
                                RMS
    SOURCE . . . .   PERIODIC NOISE
                                DEFINE ATTEN . . . . .0 dB
    INPUT . . . .   SINGLE CAL
    Ground Switch . . .   CHASSIS

2. When the calibration is complete, press the -hp-3561A START key to initiate a measurement.

3. When the average is complete, move the marker to 10 kHz and record the marker amplitude (Y:) reading in the V1 position of the Performance Test Record.

4. Remove the 50 Ω termination from the -hp-3561A input connector. Connect the noise source directly to the -hp-3561A input connector.

5. Press the -hp-3561A START key to initiate a measurement.

6. When the average is complete, move the marker to 10 kHz and record the marker amplitude (Y:) reading in the V2 position of the Performance Test Record.

7. Calculate the noise source output resistance on the Performance Test Record.

2-20 Noise Source Amplitude Accuracy/Flatness †

This test uses the -hp-3561A input channel to measure the flatness of the noise source over frequency and the RMS amplitude accuracy. The noise source level accuracy is measured using the Band Power special marker. The flatness specification is then calculated by dividing the band power reading by 20 to obtain the noise per bin on the -hp-3561A display and then multiplying by the flatness specification to obtain the acceptable deviation.

Table 2-13 Noise Source Flatness Measurement

Noise Source	Baseband/ Zoom	Start Frequency	Frequency Span
† Periodic	Baseband	0 Hz	100 kHz
Periodic	Baseband	0 Hz	10 kHz
Periodic	Zoom	21 kHz	10 kHz
† Random	Baseband	0 Hz	100 kHz
Random	Baseband	0 Hz	20 kHz
Random	Zoom	50 kHz	50 kHz

† When performing an operational verification rather than a full performance test, complete these measurements only.

SPECIFICATION

RMS Amplitude Accuracy

The maximum in-band power output into a 50 Ω termination is specified in the Amplitude Accuracy column, and the Amplitude flatness over the specified frequency span is listed in the Amplitude Flatness Column.

NOTE
Random source flatness can only be measured with long term averaging (16000), for shorter averages, add .4 dB × (1000/number of averages) to the Amplitude Flatness specification. This value has already been factored into the tolerances listed on the Performance Test Record.

Table 2-14 Noise Source Amplitude Accuracy Specification

Noise Source Selected	Frequency Span	Baseband/ Zoom	Amplitude Accuracy	Amplitude Flatness
Periodic	100 kHz	Baseband	0.7 Vrms ± .07 Vrms	± 0.8 dB
Periodic	≤ 50 kHz	Baseband	0.7 Vrms ± .07 Vrms	± 0.7 dB
Periodic	all	Zoom	0.5 Vrms ± .075 Vrms	± 1.0 dB
Random	100 kHz	Baseband	0.7 Vrms ± .14 Vrms	± 1.6 dB
Random	≤ 50 kHz	Baseband	0.7 Vrms ± .07 Vrms	± 0.7 dB
Random	all	Zoom	0.5 Vrms ± .075 Vrms	± 2.0 dB

2-38

Noise Source Flatness: Maximum Noise Level

The maximum noise level specification for each noise source/frequency span combination is calculated from the band power marker value as shown in the equation below. Division by 20 in this equation converts band power to power per bin.

Specification = Band Power Value × (1 + percent tolerance)/20

Noise Source Selected	Frequency Span	Baseband/ Zoom	Specification Maximum Noise Level		Measured Value

Periodic	10 kHz	Zoom	_____ mVrms × (1.259/20) =	_____ mVrms	_____ mVrms
Random	100 kHz	Baseband	_____ mVrms × (1.259/20) =	_____ mVrms	_____ mVrms†
Random	20 kHz	Baseband	_____ mVrms × (1.135/20) =	_____ mVrms	_____ mVrms
Random	50 kHz	Zoom	_____ mVrms × (1.318/20) =	_____ mVrms	_____ mVrms

Noise Source Flatness: Minimum Noise Level

The minimum noise level specification for each noise source/frequency span combination is calculated from the band power marker value as shown in the equation below. Division by 20 in this equation converts band power to power per bin.

Specification = Band Power Value × (1 − percent tolerance)/20

Noise Source Selected	Frequency Span	Baseband/ Zoom	Specification Minimum Noise Level		Measured Value
			Band Power(BND:) Marker Value	Calculated Value	Marker Yr: reading
Periodic	100 kHz	Baseband	_____mVrms × (.9120/20) =	_____mVrms	_____mVrms†
Periodic	20 kHz	Baseband	_____mVrms × (.9226/20) =	_____mVrms	_____mVrms
Periodic	10 kHz	Zoom	_____mVrms × (.7943/20) =	_____mVrms	_____mVrms
Random	100 kHz	Baseband	_____mVrms × (.7943/20) =	_____mVrms	_____mVrms†
Random	20 kHz	Baseband	_____mVrms × (.8810/20) =	_____mVrms	_____mVrms†
Random	50 kHz	Zoom	_____mVrms·× (.7586/20) =	_____mVrms	_____mVrms†

SECTION III
ADJUSTMENTS

SECTION III
ADJUSTMENTS

3-1 INTRODUCTION

This section describes the adjustments which will return the -hp-3561A to specified operating accuracy after repairs are completed or for periodic maintenance. Before adjustments are made, the -hp-3561A must have a 15 minute warm-up and the line voltage should be +5/-10% of nominal. The adjustment procedures are listed in the order in which they should be performed. This order must be followed since certain adjustment results are measured by the -hp-3561A itself.

3-2 SAFETY CONSIDERATIONS

Although the -hp-3561A has been designed in accordance with international safety standards, this manual contains information, cautions, and warnings which must be followed to ensure safe operation and to keep the unit in safe condition. Service and adjustments should be performed only by qualified personnel who are aware of the hazards involved.

WARNING

Any interruption of the protective (grounding) conductor inside or outside the unit, or disconnection of the protective earth terminal is likely to make the unit hazardous. Capacitors inside the -hp-3561A may still be charged even though the -hp-3561A has been removed from the mains supply.

Only fuses with the required rated current and specified type should be used for replacement. The use of repaired fuses and short circuiting of fuse holders is not permitted. Whenever it is likely that the protection offered by the fuse has been impaired, the -hp-3561A must be made inoperative and secured against any unintended operation.

Adjustments described in this section are performed with the protective covers removed and the power applied. Energy available at many points can, if contacted, result in serious personal injury.

3-3 EQUIPMENT REQUIRED

The test equipment required to adjust the -hp-3561A is listed in Table 1-5, Recommended Test Equipment. The test equipment needed for the adjustment of each particular assembly is also listed at the beginning of the adjustment procedure for that assembly. If the recommended equipment is not available, a substitute which meets or exceeds the "Required Characteristics" given in Table 1-5 may be used.

3-4 ADJUSTMENT LOCATIONS

As an adjustment aid, locators for each assembly are given at the beginning of each of the assembly adjustment procedures. These locators are simplified illustrations of the assembly showing the location of the test points and adjustable components.

3-5 ADJUSTMENT SUMMARY

CAUTION

The -hp-3561A contains components which may be damaged as a result of static discharge. Remove circuit assemblies only at a static protected workstation.

The adjustments are listed in the order in which they should be performed. Any deviation from this order is not recommended. However, after an assembly repair, it is only necessary to adjust the repaired assembly.

Refer to Table 3-1 for the list of the adjustments. If any of the adjustment results are unattainable, refer to the troubleshooting section for that assembly.

Table 3-1 -hp-3561A List of Adjustments

Paragraph Number	Test Name
3-6	A71 Power Supply Low Line Detect Adjustment
3-7	A90 CRT Display Adjustment
3-8	A40 Reference Oscillator Adjustment
3-9	A15 Digitizer Assembly Adjustment
3-10	A10 Input Assembly Adjustment
3-11	A50 Local Oscillator/Noise Source Adjustment

3-6 A71 Power Supply Low Line Detect Adjustment Procedure

This adjustment sets the Low-Line sense trip point.

EQUIPMENT NEEDED

Variable ac Source

SETUP PROCEDURE

1. With the power removed, remove the top cover of the -hp-3561A.

2. Remove PC cover plate (cover plate behind the CRT) over the power supply assemblies by removing the four screws in the plate's corners.

3. Set the -hp-3561A input voltage selection switches located on the bottom side of the motherboard to the 100V position as shown in Figure 3-1.

Figure 3-1 100V Input Voltage Selection Switch Setting

Bottom Cover

Front of -hp- 3561A

Set for 100 V

~VOLTAGE SELECTOR

100V 120V 220V 240V

Rear of -hp- 3561A
ADJUSTMENT PROCEDURE

1. Set the variable ac source to 100V ± 4V and turn on the -hp-3561A.
2. Adjust A71R1 fully CCW. (See Figure 3-2)
3. Adjust the variable ac source down to 82V ± 1V.
4. Adjust A71R1 slowly CW just to the point where the -hp-3561A goes into its power-up reset routine.
5. Turn the power off and reset the -hp-3561A line voltage switches to the proper position.

   This completes the A71 Power Supply adjustment.

3-4
ADJUSTMENT PROCEDURE

NOTE
Refer to Figure 3-3 for adjustment and test point locations.

WARNING

The following adjustments expose hazardous voltages!

1. With the power cord removed from the instrument, remove the top cover of the -hp-3561A by turning the four screws on the top cover one-quarter turn CCW. Also remove the long aluminum PC cover located on the right side of the instrument opposite the CRT.

2. Apply power to the -hp-3561A and move the A60J100 jumper from the Normal position to the FB (Full Bright) position as shown in the diagram in Figure 3-4.

    The CRT should now display a bright checkerboard pattern.

Figure 3-4 A60J100 Jumper Position

A60 Assembly
3.   Adjust A90R200 "G1" until the CRT pattern is no longer visible.

4.   Connect the HV Probe ground clip to A90 TP "GND" located directly above
        A90U1.

5.   Using the HV Probe, measure the voltage at TP300 (or J300(10)). Adjust A90R300
        "BRIGHT" for a reading of 400Vdc ±10V.

6.   Readjust A90R200 "G1" fully CW and then CCW until the background raster
        just disappears. The checkerboard pattern should now be at its brightest level
        without "blooming" or fuzz at the edges.

7.   Adjust A90R201 "FOCUS" for the best overall screen focus.

8.   Move the A60J100 jumper back to the normal position (see Figure 3-4) and then
        press the front panel PRESET key.

9.   Adjust A99L101 "VERTICAL SIZE" to align the soft key separator lines as shown
        in Figure 3-5. (Note: A99L101 is located on the A99 Assembly next to the flyback
        transformer.)

Figure 3-5 A99L101 Adjustment Reference (soft key separator alignment)

Top View
of -hp- 3561A
10. Place the -hp-3561A in test mode 50 by pressing the following keys:

    MODE .... TEST SELECT..... ....50 ENTER
                    START SNGL TST

    The CRT should now show the display alignment pattern shown in Figure 3-6.

11. Adjust A90R2 "WIDTH" until the width of the alignment pattern is approximately 3.8 inches (97mm). Refer to Figure 3-6 for the alignment example.

Figure 3-6 Display Alignment Pattern
12. Adjust A90R1 "LEFT EDGE" to center the alignment pattern in the CRTK display. Refer to Figure 3-6 for the alignment example.

13. Press the soft key STOP TEST.

14. Press the front panel PRESET key.

15. Adjust A90R100 "HALF BRIGHT" for a comfortable viewing contrast between half bright and full bright characters on the display.

16. Readjust A90R201 "FOCUS" if necessary.

17. Repeat steps 7 through 16 to "fine tune" the display alignment.

    This completes the adjustments for the CRT display.

3-7

3-8 A40 Reference Oscillator Adjustment Procedure
This adjustment sets the frequency of the -hp-3561A's reference oscillator.

EQUIPMENT NEEDED

Frequency Synthesizer ....-hp-3325A

Figure 3-7 A40 Adjustment Locator
ADJUSTMENT PROCEDURE

1. Set the frequency synthesizer to 99 kHz at an amplitude of 1Vrms.

2. Connect the output of the frequency synthesizer to the front panel input of the
    -hp-3561A.

3. Press the following -hp-3561A front panel keys:

    FORMAT ....   SINGLE
    FREQuency ......   DEFINE CENTER.. ....99 kHz
                       DEFINE SPAN ....5 kHz
    WINDOW ....   UNIFORM

4. A measurement will be made and displayed on the CRT.
5. Adjust A40C201 for minimum skirt width as shown in Figure 3-8.

Figure 3-8 Correctly and Incorrectly Adjusted A40C201
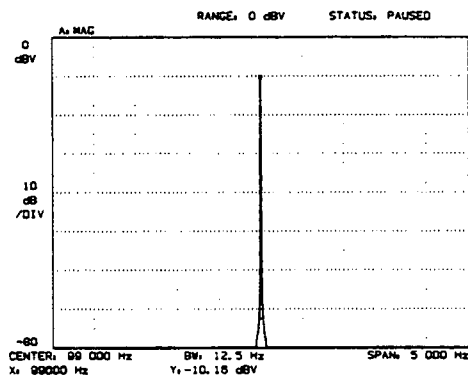

A40C201
Correctly Adjusted
for a minimum
width skirt

Incorrectly
Adjusted

3-9   A15 Digitizer Assembly Adjustment Procedure

Figure 3-9 Digitizer Adjustment Setup
The A15 adjustment procedure assumes all the -hp-3561A assemblies are installed and functional. To perform the adjustments, the top cover of the -hp-3561A must be removed. The long cover plate over the PC assemblies in the right side of the instrument (opposite the CRT) must also be removed by unscrewing the four pan-head screws (two on each end of the plate).

EQUIPMENT NEEDED

Oscilloscope . . . .-hp-1980A
Frequency Synthesizer . . . .-hp-3325A
50Ω Feedthrough . . . .-hp-11048C

Figure 3-10 A15 Adjustment Locator
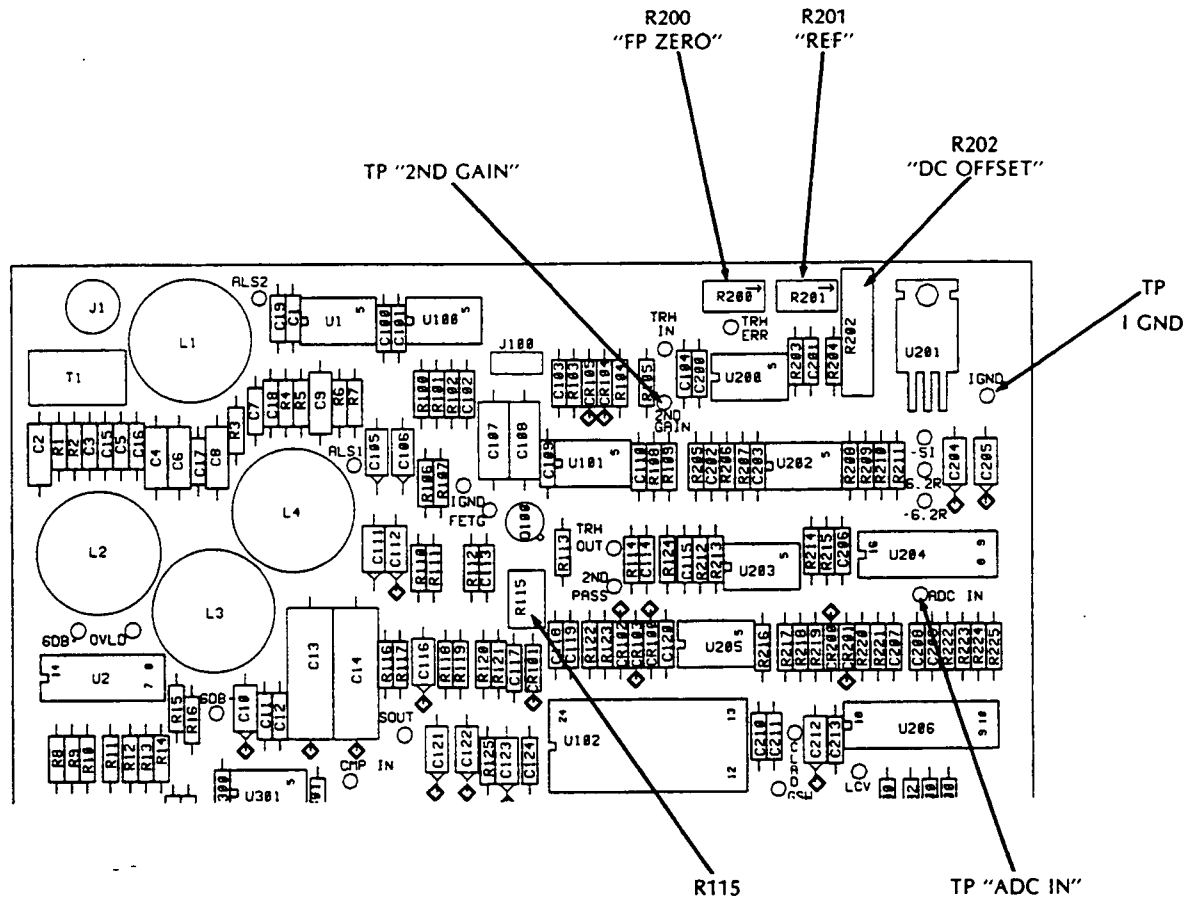

SECOND GAIN ADJUSTMENT

Refer to the test setup shown in Figure 3-9 and follow the directions below.

1. Connect the "SYNC OUT" of the frequency synthesizer to the "MAIN TRIG IN" input of the oscilloscope and set the oscilloscope to the External Trigger mode.

2. Remove the coax cable (W15) from A15J1.

3. Connect the SIGNAL output of the frequency synthesizer to A15J1 using the adapter cable -hp- PN 03585-61616 and a 50Ω load.

4. Set the frequency synthesizer output waveform to triangle with a frequency of 200 Hz and an amplitude of 10mVrms.

5. Program the -hp-3561A for an input RANGE of 0 dBV and the AUTO-RANGE function to OFF.

6. Place the -hp-3561A into test mode 114 by pressing the following keys in the following order:

    MODE . . . .   TEST SELECT . . . . .114 ENTER
                               START SNGL TST

    The display of the -hp-3561A should indicate that test 114 is complete. At this time, the -hp-3561A is programmed properly and the rest of the adjustment may be performed. If the display does not indicate that test 114 is complete, repeat step 6.

7. Set the oscilloscope sensitivity to 5.0mV/Div. and the time base to 1.0mS/Div.

8. Connect the oscilloscope probe to A15 TP "2ND GAIN" which is located next to resistor R105. Connect the probe ground clip to the A15 "I GND" TP which is located in the upper-right corner of the A15 assembly next to regulator U201. Refer to Figure 3-10 for TP and adjustment locations.

9. Adjust A15R115 2ND GAIN for a flat waveform on the oscilloscope as seen in the left photo of Figure 3-11.

Figure 3-11 Correctly and Incorrectly Adjusted R115

Correctly adjusted R115   Incorrectly adjusted R115

      Coupling - dc
      Ground - Center Graticule

Trigger: Internal - Ch1
         Slope - Positive

Bandwidth Limit: OFF

FIRST PASS ADJUSTMENT PROCEDURE

Use the test equipment interconnect setup as shown in Figure 3-9 and follow steps 1 and 2 of the Second Gain Adjustment procedure when connecting the equipment.

1. Set the frequency synthesizer output waveform to triangle with a frequency of 200 Hz and an amplitude of 200mVrms.

2. Connect the oscilloscope probe to A15 TP"ADC IN" located below IC U204. Connect the ground clip to the A15 "I GND" TP located in the upper-right corner of the A15 assembly near regulator U201.

3. Program the -hp-3561A for an input RANGE of 0dBV with the Auto-Range function to OFF.

4. Program the -hp-3561A for the INPUT AUTO-CAL off.

5. Place the 3561A into Test Mode 111 by pressing the following keys in the following order:

    MODE . . . .   TEST SELECT. . . . . .111 ENTER
                               START SNGL TST

3-13

6.   Set the oscilloscope sensitivity to 10mV/Div and the time base to 1.0mS/Div.

7.   Adjust R201 "REF" for a flat response as shown in the left photo of Figure 3-12.

Figure 3-12 Correctly and Incorrectly Adjusted R201 "REF"

        Slope - Positive
Bandwidth Limit: OFF

3-14

DC OFFSET ADJUSTMENT

The DC Offset Adjustment does not require the use of any test equipment. Adjustment is made using the -hp-3561A CRT in the PRESET state.

1. Remove the coax cable (W15) from A15J1.
    Short A15J1 using a test lead or shorting connector.

2. Press the PRESET key on the front panel of the -hp-3561A.

3. Press the following keys on the -hp-3561A front panel:

    FORMAT . . . .   SINGLE

4. Adjust A15 R202 for a minimum peak at the dc (left-most) point of the -hp-3561A CRT display. Refer to the left waveform in Figure 3-14 for the properly adjusted response.

5. Remove the short from A15J1 and replace the coax cable coming from the A10 Assembly.

Figure 3-14 A15 R202 DC Offset Adjustment

Correctly adjusted R202
Incorrectly adjusted R202

Minimum DC response
DC response out of adjustment

3-10 A10 Input Assembly Adjustment Procedure

There are five adjustments on the A10 Input Assembly: Zero, Amplitude, 20dB Attenuator flatness, 40dB Attenuator flatness and A-Weight Filter.

EQUIPMENT NEEDED

AC Calibrator . . . . .Fluke 5200A
Frequency Synthesizer . . . .-hp- 3325A
Extender Board . . . .-hp- 03561-66595
Adjustment Tool 0.1in hex . . . .-hp- 8710-1388
BNC to J cable adapter . . . .-hp- 03585-61616

Figure 3-15 A10 Assembly Adjustment Locations
SETUP PROCEDURE

1. With the power cord removed from the instrument, remove the top and bottom covers from the -hp-3561A by turning the four screws of each cover CCW.

2. Carefully remove the input cable coming in at the lower left of the A10 Input Assembly by pulling it straight out toward the front of the instrument.

3. Remove the A10 assembly and reinsert into the instrument on an extender board.

4. Connect the BNC to J cable to A10J300 (located in the lower-left corner of the A10 assembly).

ZERO ADJUSTMENT PROCEDURE

This adjustment does not require the use of external equipment.

1. Disconnect any signal going into the A10 assembly.

2. Move the A10W100 jumper from the N (normal) position to the T (test) position. This jumper is located in the top center of the A10 assembly. (Refer to Figure 3-15)

3. Press the -hp-3561A PRESET key. The CRT will show both a MAG and TIME display. The 0Hz (dc) portion of the MAG display should be greater than 35dB down from full scale as shown in the left diagram of Figure 3-16.

4. Adjust A10R9 "ZERO" for the minimum response at 0 Hz (dc).

5. Move the Jumper A10W100 back to the N position.

Figure 3-16 Response Of A10 ZERO Adjustment

Minimum
DC response

DC response out
of adjustment
AMPLITUDE ADJUSTMENT PROCEDURE

1. Connect the frequency synthesizer signal output to the Fluke 5200A PHASE LOCK (located on the rear panel).

2. Connect the Fluke 5200A front panel output to the BNC adapter cable going to A10J300.

3. Set the output of the synthesizer to 1 kHz at 2.0Vrms.

4. Set the Fluke 5200A AC Calibrator front panel controls as follows:

VOLTAGE RANGE	1.0V
VOLTAGE ERROR	OFF
FREQUENCY RANGE	10k
VOLTAGE	200mV
FREQUENCY	1.000kHz
CONTROL	LOCAL
PHASE LOCK	ON
SENSE	INT
MODE	OPERate

3-18

5. Press the following front panel keys:

PRESET
MODE . . . .   TEST SELECT. . . . . .52 ENTER
                            START CONT TST

The CRT will display the instructions to input a sinewave signal of 1 kHz at 200mVrms.

6. Input the 1 kHz signal to the A10 assembly and press the menu key "CONTINUE".
The CRT will display "Calibration deviation = value" where value is the numerical amount of error in the amplitude adjustment.

7. Adjust A10R500 "CAL" until the value of the error is equal to 0.00 ±.05.

When the adjustment is finished, press the menu key STOP TEST.

20dB ATTENUATOR FLATNESS ADJUSTMENT PROCEDURE

This adjustment does not require the use of external equipment.

1. Press the following keys on the -hp-3561A front panel:

PRESET
MODE . . . .   TEST SELECT. . . . . .53 ENTER
                            START CONT TST

The -hp-3561A CRT should display "TEST # 53 IN PROGRESS" and "Calibration deviation = value" where value is the numerical amount of error in the adjustment of the 20dB attenuator circuit.

2. Adjust A10C303 until the value of the error is equal to 0.00 ±.05.

When the adjustment is finished, press the menu key STOP TEST.

40dB ATTENUATOR FLATNESS ADJUSTMENT PROCEDURE

This adjustment procedure does not require the use of external equipment.

1. Press the following keys on the -hp-3561A front panel:

PRESET
MODE . . . .   TEST SELECT. . . . . .54 ENTER
                            START CONT TST

The -hp-3561A CRT should display "TEST # 54 IN PROGRESS" and "Calibration deviation = value" where value is the numerical amount of error in the adjustment of the 40dB attenuator circuit.

2. Adjust A10C300 until the value of the error is equal to 0.00 ±.05.
    When the adjustment is finished, press the menu key STOP TEST.

A-WEIGHT FILTER ADJUSTMENT PROCEDURE

EQUIPMENT NEEDED

Frequency Synthesizer . . . .-hp-3325A

ADJUSTMENT PROCEUDRE

1. Press the following keys on the -hp-3561A front panel:

    PRESET
    INPUT . . . .   A WT FLT
                                  ON OFF

    This should turn the A-Weight Filter on.

2. Connect a 50Ω load to the A10 input cable and adjust A10R201 for a minimum
    0Hz response as shown in the left diagram of Figure 3-16.

3. Connect the frequency synthesizer to the input cable of the A10 Assembly and
    set as follows:

    FREQUENCY . . . . .2.5 kHz
    FUNCTION . . . . .SINE
    AMPLITUDE 1.0Vrms

4. Press the following keys on the -hp-3561A front panel:

    PRESET
    MKR . . . .   DEFINE MKR POS . . . . .2.5 kHz
    INPUT. . . . .   A WT FLT
                                  ON OFF

    The -hp-3561A should now be making baseband measurements of the 2.5 kHz
    input signal with the Y-MARKER and the A-Weight Filter turned on.

5. Adjust A10R202 "GAIN" for a Y-MARKER reading of +1.3dBV ±.02dB as
    indicated by the left diagram in Figure 3-17.

Figure 3-17 Response Of A10 A-Weight Filter Adjustment
Y-MARKER properly
adjusted to +1.30 dBV

3-11 A50 Local Oscillator/Noise Source Adjustment Procedure

This adjustment does not require the use of external equipment.

SETUP PROCEDURE

Connect the -hp-3561A rear panel noise source output to the front panel input BNC using a 50Ω load.

Figure 3-18 A50R400 Adjustment Location

ADJUSTMENT PROCEDURE

1.   Press the following -hp-3561A front panel keys:

PRESET
WINDOW ....   UNIFORM
FREQuency ......   DEFINE SPAN ....25 kHz
MarKeR ....   DEFINE MKR POS   ....12.5 kHz
SOURCE.........   PERIODIC NOISE
                  DEFINE ATTN ....0 dB

2.   Adjust A50R400 until the Y-MARKER reads -28.9dBV ±.04dBV as shown in Figure 3-19.

Figure 3-19 A50R400 Adjustment Reference
Y-MARKER properly
adjusted to − 28.90 dBV

SECTION IV
REPLACEABLE PARTS

SECTION IV
REPLACEABLE PARTS

4-1 INTRODUCTION

This section of the manual contains information for ordering replaceable parts for the -hp-3561A. Table 4-1 lists standard abbreviations used in the parts list. Table 4-2 is a listing of all the replaceable parts in order of reference designator. Table 4-3 lists the names and addresses which correspond to the manufacturer's code numbers.

4-2 STANDARD ABBREVIATIONS

The standard abbreviations used in the parts list and throughout the manual are listed in Table 4-1. In some cases, two forms of an abbreviation are used, one in all CAPITAL letters and one in partial or no capital letters. Abbreviations in the parts list are given in all capital letters, on the schematics and in other parts of the manual abbreviations may be given in either lower case or capital letters.

Table 4-1 Reference Designations and Abbreviations

4-3 ORDERING INFORMATION

To order a`part listed in Table 4-3, quote the Hewlett-Packard part number (with the check digit) and indicate the quantity required. To order a part not listed in Table 4-3, include the instrument Model Number (-hp-3561A), the instrument serial number, a description and function of the part, and the quantity of the part required. Address the order to the nearest Hewlett-Packard office (office locations are listed at the back of this manual).

4-4 MANUFACTURER'S CODE LIST

The information given in the parts list includes the manufacturer's code and part number. Table 4-2 contains the names and addresses which correspond with the manufacturer's code number.

Table 4-2 Manufacturer's Code List

Mfr No.	Manufacturer Name	Address
01121	Allen-Bradley Co	Milwaukee WI 53204

4-5 REPLACEABLE PARTS LIST

Table 4-3 is the list of replaceable parts in the -hp-3561A and is organized as follows:

a. Electrical assemblies and their components are listed in numerical order.

b. Chassis-mounted parts are listed in order of their reference designation.

c. Miscellaneous parts.

4-2

The parts list contains seven columns. The descriptions for these columns are given below:

Column 1: Reference Designation

This is the reference designation of the part. It is a two part number. The first part identifies the assembly on which the component is located. The second part identifies the component type and location as it is mounted on the PC assembly. For example: component A10R101 is on the A10 Assembly, it is a resistor, and it is the upper-left resistor located in quadrant 100.

Column 2: HP Part Number

This is the Hewlett-Packard part number for the component.

Column 3: CD

This is the Check Digit for the Hewlett-Packard part number. It is an internal number used by Hewlett-Packard to verify the validity of the part number.

Column 4: Qty

This is the total quantity of that part used on the assembly. The total quantity for each part is given only once per assembly at the first appearance of the part number in the assembly parts list.

Column 5: Description

This is a description of the part sometimes including color, power rating, value, etc.

Column 6: Mfr Code

This is a Hewlett-Packard internal code number assigned to the various manufacturing vendors. Table 4-3 lists the name and address of the manufacturers along with their Mfr. Code number.

Column 7: Mfr Part Number

This is the part number assigned to the part by the manufacturer.

4-6 DIRECT MAIL ORDER SYSTEM

Within the USA, Hewlett-Packard can supply parts through a direct mail order system. Advantages of using the system are:

a. Direct ordering and shipment from the HP Parts Center in Mountain View, California.

b. No maximum or minimum on any mail order (there is a minimum order amount for parts ordered through a local HP office when the order requires billing and invoicing).

c. Prepaid transportation (there is a small handling charge for each order).

d. No invoices — to provide these advantages, a check or money order must accompany each order.

Mail order forms and specific ordering information are available through your local HP office. The addresses and phone numbers of the offices are located at the back of this manual.

SECTION V
BACKDATING

SECTION V
BACKDATING

5-1 INTRODUCTION

The purpose of this section is to provide the information necessary to modify this manual to apply to instruments which have revision A PC Assemblies only. Note that some of the circuit assemblies are revised for ease of manufacturing and do not necessarily incorporate circuit changes. For this reason, some revision A assemblies are identical to revision B assemblies.

5-2 MANUAL CHANGES

Table 5-1 lists the current revision letter for each PC Assembly. Refer to the assembly headings following Table 5-1 for the actual manual changes.

Table 5-1 Revision A Assemblies Versus Revision B Assemblies

The following assemblies are currently revision A:
A72 Power Supply Filter Assembly A80 Keyboard Assembly A81 Keyboard Driver Assembly A90 Analog Display Assembly
The following assemblies are currently revision B:
A10 Input Amplifier Assembly A15 Digitizer Assembly A20 Digital Filter Assembly A30 FFT/RAM Assembly A40 Processor/ROM Assembly A50 Local Oscillator/Noise Source Assembly *A60 Digital Display Driver Assembly *A65 CMOS/Bubble Memory Assembly (Option 001) *A66 CMOS Memory Assembly *A70 Power Supply PWM Assembly *A71 Power Supply Transformer Assembly A82 Rear Panel Assembly A99 Motherboard Assembly

*These assemblies are revised for ease of manufacturing and do not incorporate circuit changes. For this reason, no backdating information is necessary.

5-1

5-3   A10 Input Amplifier Assembly Backdating

Do the following to modify the A10 Assembly information to reflect revision A:

1.   Replace the A10 component locator in Section VII with the revision A compo-
     nent locator in Figure 5-1a.

2.   Delete capacitor C7 (0160-4792 8.2pf) from the A10 schematic (Circuit E) and
     replaceable parts list.

3.   Delete capacitor C8 (0160-4811 270pf) from the A10 schematic (Circuit D) and
     replaceable parts list.

Figure 5-1a A10 Assembly Revision A Component Locator
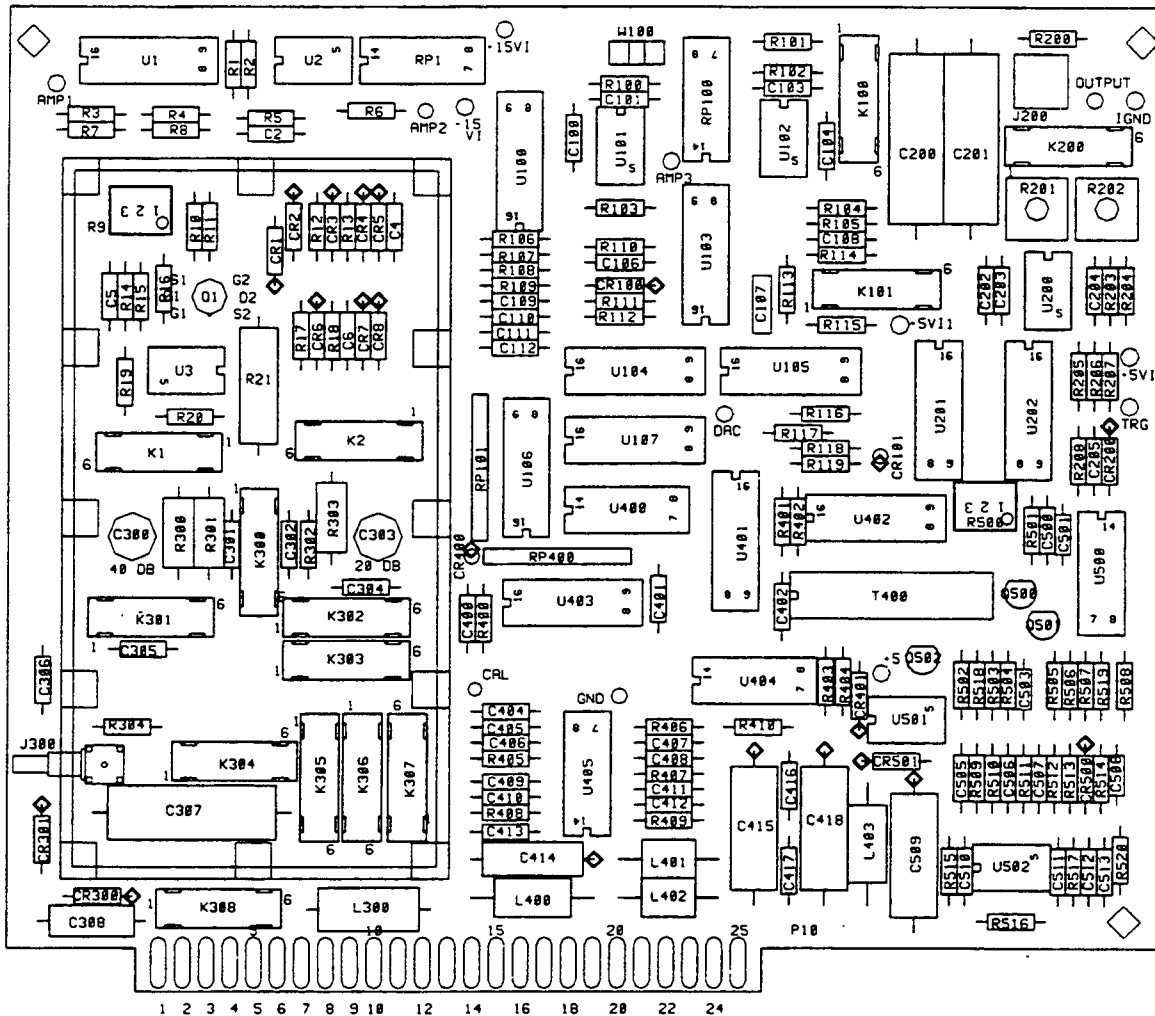

5-4 A15 Digitizer Assembly Backdating

Do the following to modify the A15 Assembly information to reflect revision A:

1. Delete Test Point "SOUT" from the A15 schematic (Circuit L).

2. Delete capacitor C501 (0160-4808 470PF) from the A15 schematic (Circuit L) and replaceable parts list.

3. Delete resistor R226 (0757-0484 619K) from the A15 schematic (Circuit L) and replaceable parts list.

4. Delete resistor R503 (0757-0443 11K) from the A15 schematic (Circuit L) and replaceable parts list.

5. Replace the A15 component locator in Section VII with the revision A component locator in Figure 5-1b.

Figure 5-1b A15 Revision A Component Locator
5-5 A20 Digital Filter Assembly Backdating

Do the following to modify the A20 Assembly information to reflect revision A:

1.   Delete Test Point TP503 from the A20 schematic (Circuit U).
2.   Delete Test Point TP504 from the A20 schematic (Circuit U).

5-6 A30 FFT/RAM Assembly Backdating

Do the following to modify the A30 Assembly information to reflect revision A:

1.   Delete Test Point TP704 from the A30 schematic (Circuit H).
2.   Delete Test Point TP705 from the A30 schematic (Circuit H).

5-7 A40 Processor/ROM Assembly Backdating

Do the following to modify the A40 Assembly information to reflect revision A:

1.   Replace the A40 component locator in Section VII with the revision A component locator in Figure 5-2.

5-4

Model 3561A

Backdating

Figure 5-2 A40 Assembly Revision A Component Locator
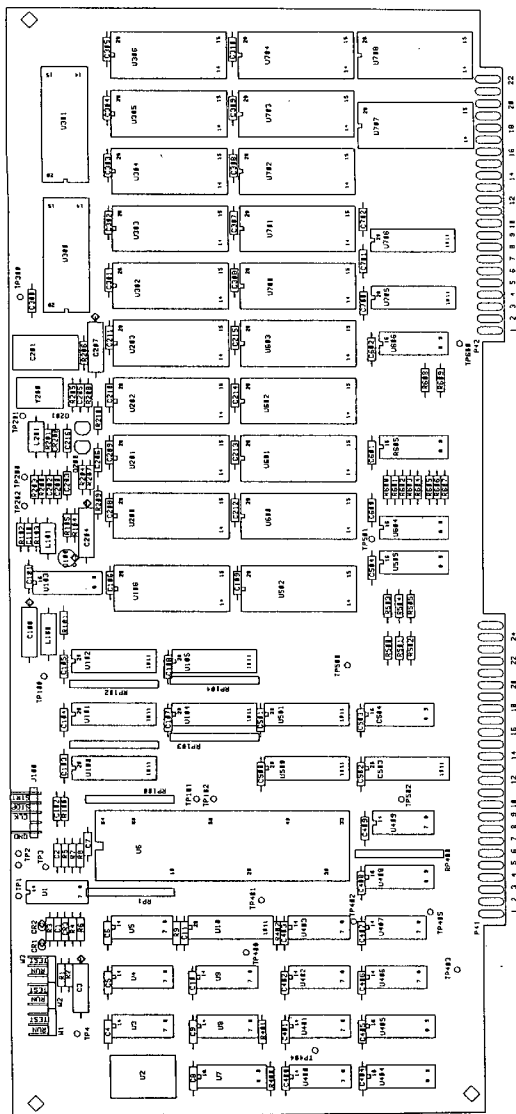

Backdating

5-8 A50 Local Oscillator/Noise Source Assembly Backdating

Do the following to modify the A50 Assembly information to reflect revision A:

1. Replace the A50 component locator in Section VII with the revision A component locator in Figure 5-3.

Figure 5-3 A50 Assembly Revision A Component Locator
2. Delete the power supply RC filter circuits going to pins 4 and 7 of U401 (Circuit FF), U403 (Circuit CC), U404 (Circuit HH) and U902 (Circuit II) as shown in Figure 5-4.

Figure 5-4 A50 Assembly RC Filter Deletion
From this: To this:
3. Delete the four ±12V .1uF filter capacitors C410, C411, C904 and C905 connected to L900 and L901 from the A50 schematic.

4. Delete the 10pF capacitor C907 connected between pins U404(2,6) from the A50 schematic (Circuit HH).

5. Delete the 100pF capacitor C906 connected between pins U902(2,6) from the A50 schematic (Circuit II).

6. Delete the 100Ω resistor R905 connected between U902(2) and the cathode of CR900 (Circuit II) and replace with a short circuit. U902(2) should now connect directly to the cathode of CR900.

7. Change the Functional Circuit GCLOCK GENERATOR K as shown in Figure 5-5.

5-9

8. Change capacitor C401 from .1uF to 27pF on the A50 schematic (Circuit CC).

9. Delete inductor L902 from the A50 schematic (Circuit II).

10. Change resistor R902 from 10kΩ to 1kΩ on the A50 schematic (Circuit II).

11. Delete the following twelve .1uF capacitors (0160-4571) from the A50 replaceable parts list: C410, C411, C413, C414, C415, C416, C417, C418, C904, C905, C908 and C909.

12. Delete the following eight 48.7Ω resistors from (0698-4381) the A50 replaceable parts list: R409, R410, R411, R412, R413, R414, R906 and R907.

13. Delete 10pF capacitor C907 (0160-4791) from the A50 replaceable parts list.

14. Delete 100pF capacitor C906 (0160-4801) from the A50 replaceable parts list.

15. Delete 100Ω resistor R905 (0757-0401) from the A50 replaceable parts list.

16. Delete U010 (1820-2657) from the A50 replaceable parts list.

17. Change capacitor C401 from 0160-4786 (27pf) to 0160-4795 (4.7pf) in the A50 replaceable parts list.

18. Change resistor R902 from 0757-0280 (1K) to 0757-0401 (10K) in the A50 replaceable parts list.

19. Delete inductor L902 (9100-3551 1uH) from the A50 replaceable parts list.

5-9   A82 Rear Panel Assembly Backdating

Do the following to modify the A82 Assembly information to reflect revision A:

1.   Replace the A82 component locator in Section VII with the revision A compo-
     nent locator in Figure 5-6.

Figure 5-6 A82 Assembly Revision A Component Locator
2.   Delete U1 and C6 from the A82 schematic.

3.   Delete U1 (1820-2024) from the A82 replaceable parts list.

4.   Delete C6 (0160-4571) from the A82 replaceable parts list.

5-10 A99 Motherboard Assembly Backdating

Do the following to modify the A99 Assembly information to reflect revision A:

1. Replace the A99 component locator in Section VII with the revision A component locator in Figure 5-7.

2. Delete C104 from the A99 schematic and connect R102 directly across L101.

3. Delete capacitor C104 (0160-3455) from the A99 replaceable parts list.

4. Change resistor R102 from 0757-0159 (1k 1/2W) to 0764-0016 (1k 2W) in the A99 replaceable parts list.

SECTION VI
FAULT ISOLATION

SECTION VI
FAULT ISOLATION

6-1 INTRODUCTION

The information given in this section is used to isolate failures to a circuit board. Once the failure is isolated to a circuit board, the information given in Section 7 is used to further isolate the failure to a component. Figure 6-1 illustrates the use of the information given in this section. The fault isolation procedure is the primary tool for isolating a failure to the circuit board level. To isolate a failure, start the fault isolation procedure with TEST A, and continue with each test in alphabetical order until one of the test fails. The failed test will indicate the circuit board which most likely caused the failure. Troubleshooting to the component level on the failed circuit board can then be continued in Section 7.

The self calibration paragraph describes the 3561A's self calibration procedure and lists the calibration failure messages.

The troubleshooting guidelines paragraph gives a list of failure symptoms and the corresponding circuit boards which most likely caused the failure. A recommended starting point in the fault isolation procedure is listed for each failure symptom.

The diagnostic/self-tests paragraph contains a description of each of the internal diagnostic routines. For each test, a description of how the test works and a list of return codes is given.

The overall instrument theory of operation paragraph gives a description of the interaction of the circuit boards in the -hp-3561A.

6-2 SAFETY CONSIDERATIONS

WARNING

Maintenance described herein is performed with power supplied to the instrument and with the protective covers removed. Such maintenance should be performed only by service-trained personnel who are aware of the hazards involved (for example, electrical shock and fire).

Any interruption of the protective grounding conductor inside or outside the instrument, or disconnection of the protective earth terminal, is likely to make the instrument hazardous.

WARNING

±170 Volts are present on the A70 and A71 Assemblies. ±170 Volts are present on the heat sinks on the A70 Assembly. This voltage is exposed whenever the protective power supply cover is removed. Be extremely careful when working in proximity to this area. The high voltage can cause serious personal injury if contacted.

WARNING

Capacitors in the power supply will remain charged to ±170 Volts dc for at least three(3) minutes after power is removed from the instrument. Do not remove the power supply assemblies (A70, A71, A72) for at least three(3) minutes after power is removed from the -hp-3561A.

WARNING

Only fuses with the required current rating and of the specified type should be used for replacement. The use of repaired fuses or short circuiting the fuse holder is not permitted. Whenever it is likely that the protection offered by the fuse has been impaired, the instrument must be made inoperative, and secured against any unintended operation.

WARNING

+8000 Volts are present in the CRT AT ALL TIMES, EVEN WHEN POWER IS REMOVED FROM THE INSTRUMENT. Be extremely careful when working in proximity to this area. The high voltage can cause serious personal injury if contacted.

6-3 RECOMMENDED TEST EQUIPMENT: FAULT ISOLATION

The test equipment required to perform the fault isolation procedure is listed in Table 1-5 and in Table 6-1. If the recommended equipment is not available, a substitute which meets or exceeds the required characteristics given in Table 1-5 may be used.

Table 6-1 Recommended Test Equipment for Fault Isolation

Description	Recommended Model Number
Frequency Synthesizer	-hp-3325A
Oscilloscope	-hp-1980A
Digital Voltmeter	-hp-3455A
Extender Card (44 pin)	-hp-03561-66595
Extender Card (50 pin)	-hp-03561-66596

6-4 SELF CALIBRATION

6-5 Calibration Procedure

The -hp-3561A is equipped with a self calibration circuit which is used to determine measurement correction factors. A full calibration consists of three steps: 1) Auto Zero, 2) PRN Magnitude and Phase Calibration, and 3) Harmonic Calibration.

A full calibration is performed whenever the SINGLE CAL softkey is pressed and every 30 minutes after instrument warm up. During warm up, full calibrations are performed as follows:

— At turn on
— 5 minutes after turn on
— 15 minutes after turn on
— 35 minutes after turn on
— Every 30 minutes

In addition, auto zero is performed whenever the instrument range function is changed.

AUTO ZERO

The auto zero digital to analog converter on the A10 Assembly is programmed for a minimum DC response.

6-4

PRN MAGNITUDE AND PHASE CALIBRATION

The PRN CAL signal which is generated on the A20 Assembly is selected as the input to the A10 cal level generator. A spectrum is taken and the results are used to calculate a set of magnitude and phase correction factors. These correction factors are stored by the processor and used to correct measurement data. Self test 118 may be used to read the correction factors and self test 119 may be used to clear the correction factors to zero. A complete description of these self tests is given in the diagnostics/self-test section of this manual.

HARMONIC CALIBRATION

A 2 kHz square wave is selected as the input to the cal level generator on the A10 Assembly. A spectrum is measured and the results used to calculate a time delay correction factor used for triggered measurements. This correction factor is added to the magnitude and phase correction factors and may be read and cleared in the same way.

6-6 Calibration Failures

When the calibration procedure encounters a failure, a failure message is immediately displayed on the CRT screen and the calibration procedure is stopped. Failure messages are listed below in the order in which they occur in the calibration procedure. For each cal failure, the assemblies which most likely caused the failure, the recommended starting point in the fault isolation procedure, and possible adjustments to correct the failure are listed.

NOTE
Calibration error messages remain on the CRT screen for ten seconds unless a second error is detected. A second failure message occurring less than one second after the original failure is not displayed. A second failure message occurring more than one second after the original failure replaces the original failure message.

Table 6-2 Cal Failures

Error Message and Description	Assemblies	Fault Isolation	Adjustments
CAL FAILURE: DMA TIME OUT The Digital Filter or DMA counter on the A20 assembly is not responding to the micro-processor.	A20	TEST E	
CAL FAILURE: A/D COUNTER MISMATCH The timing and control counter on the A20 Assembly is giving inconsistent readings on consecutive measurements of the cal signal.	A15, A20	TEST F	
CAL FAILURE: FFT TIME OUT The FFT processor on the A30 assembly is not responding to the microprocessor.	A30	TEST E	
CAL FAILURE: PRN PHASE BAD AT 2 KHZ The phase of the PRN calibration signal is too far off to be corrected. Large amplitude errors or a DC offset error will also result in a phase error and this error message.	A10, A15 A20	TEST F	A10, A15
CAL FAILURE: CORRECTION TOO LARGE The Amplitude of the PRN calibration signal is too far off to be corrected.	A10, A15	TEST F	A10, A15
CAL FAILURE: NO TRIGGER No input trigger has been sent from the A15 Assembly trigger comparator.	A10, A15 A20	TEST F	
CAL FAILURE: 64 KHZ PHASE UNDEFINED Unable to calculate the phase of the A20 64 kHz harmonic.	A10, A15 A20	TEST F	

6-7 TROUBLESHOOTING GUIDELINES

Table 6-3 lists several failure symptoms, the assembly which most likely caused the failure, and the suggested starting point in the Fault Isolation Procedure. If a fault isolation test is not listed, proceed with troubleshooting in Section 7 with the first assembly listed in the table. These failure symptoms are guidelines to shorten the repair time but do not contain all possible failures. When in doubt about a particular failure, start the fault isolation procedure at TEST A. Failure symptoms listed in Table 6-3 are organized as either general symptoms or as a symptom associated with a particular front panel key operation.

OPERATING DIAGNOSTIC MESSAGES

Diagnostic messages will be displayed during normal operation. Many of the messages indicate the status of the -hp-3561A such as the message "AVG COM-PLETE," or an incorrect key sequence such as the message "COMMAND INVALID FOR TIME TRACE." The messages listed below may indicate a hardware failure.

Table 6-3 Failure Symptom Table

OPERATING DIAGNOSTIC MESSAGES

Symptom of Failure (Diagnostic Message):	Troubleshooting	
	Assemblies	Fault Isolation
BUBBLE MEMORY ERROR: CANNOT INITIALIZE	A65	
BUBBLE MEMORY ERROR: RECALL FAILED	A65	
BUBBLE MEMORY ERROR: STORE FAILED	A65	
CANNOT PERFORM RECALL: FILE DATA INVALID	A66/65	
CHECKSUM ERROR DETECTED	A50	
CMOS MEMORY ERROR: RECALL FAILED	A66/65	
DMA ERROR DETECTED	A20, A30	TEST E
DMA ERROR DURING AUTO RANGE	A20, A30	TEST E
ESR PHASE COUNTER OVERFLOW	A20	
EXTERNAL SAMPLE CLOCK < 5HZ OR INCOMPATIBLE	A20	
EXTERNAL SAMPLE TOO FAST OR INCOMPATIBLE	A15, A20	TEST F
FFT ERROR DETECTED	A30	TEST E
FRONTEND PROGRAMMING ERROR DETECTED	A10, A15 A20	TEST G
NO INTERNAL CLOCK	A40, A20	TEST D
NONVOLATILE MEMORY ERROR: FORMAT REQUIRED	A65	
Indicates a hardware error only if the format routine (self test 170) fails to correct the failure.		

GENERAL SYMPTOMS

Symptom of Failure:	Troubleshooting	
	Assemblies	Fault Isolation
Harmonic distortion failure.	A10, A15 A20	
Instrument completely dead, no front panel LEDs turned on, and no display.	A70, A71 A72	TEST A
Instrument locks during the power on test.	A70, A71 A72, A40	TEST A
Keyboard responds properly but display is incorrect.	A60, A90	TEST C
Input signal amplitude varies with frequency.	A15, A10	
Input signal amplitude is incorrect.	A15, A10 A20	TEST F
Noise Level is too high.	A10, A15 A20	TEST F
Power on Test Failure - RETURN CODE (0 X XX)	A40, A30 A20, A50 A60, A65	TEST B

6-7

FRONT PANEL KEY - MODE
GENERAL HEADINGS - EXTERNAL SAMPLE, THIRD OCTAVE , FULL OCTAVE, TIME CAPTURE

Symptom of Failure:	Troubleshooting	
	Assemblies	Fault Isolation
Instrument works properly in all modes except external sample mode.	A20, A82	
Instrument works properly in external sample mode but not in internal sample mode (external sample off).	A20	TEST E
Instrument works properly in all modes except third octave and full octave.	A30, A20	TEST E
Instrument works properly in third octave and full octave modes but not in narrow band mode.	A20, A30	TEST E

FRONT PANEL KEY - TRIG SEL, ARM
GENERAL HEADINGS - INPUT TRIGGER, EXTERNAL TRIGGER, SOURCE TRIGGER, HPIB TRIGGER

Symptom of Failure	Troubleshooting	
	Assemblies	Fault Isolation
Instrument works properly with input trigger but not with external trigger.	A20, A82 W82	
Instrument works properly with external trigger but not with input trigger.	A15, A10 A20	TEST F
Instrument works properly with all triggers except HP-IB trigger or source trigger.	A50 W82	

FRONT PANEL KEY - SOURCE
GENERAL HEADINGS - PERIODIC SOURCE, IMPULSE SOURCE, RANDOM SOURCE, SOURCE SYNC

Symptom of Failure	Troubleshooting	
	Assemblies	Fault Isolation
Rear panel noise source output ("SOURCE OUT") is incorrect. Amplitude incorrect, flatness incorrect, etc.	A50, A82 W50	
Random noise source works properly but impulse or periodic source do not.	A50	
Impulse and periodic source work properly but random source does not.	A50	
Noise source output works properly, but the "SOURCE SYNC" output does not.	A50	

6-8

FRONT PANEL KEY - DEFINE TRACE
GENERAL HEADINGS - MAGNITUDE, PHASE, TIME

	Troubleshooting	
Symptom of Failure	Assemblies	Fault Isolation
Magnitude trace works properly, but phase trace does not work properly.	A20	TEST F
All traces work properly except input time and input magnitude.	A20	TEST F
Input time and input magnitude are the only traces that work properly.	A20	TEST F

FRONT PANEL KEY - STORE/RECALL, SAVE, RECALL

	Troubleshooting	
Symptom of Failure	Assemblies	Fault Isolation
Invalid data stored in M1 or M2, or in the six instrument states S1 -S6.	A30, A65	TEST D
Cannot store or recall a catalog file.	A65	TEST I
File catalog lost.	A65	TEST I

FRONT PANEL KEY - RANGE

	Troubleshooting	
Symptom of Failure	Assemblies	Fault Isolation
Instrument works properly in some range settings and improperly in other range settings.	A10, A15 A20	TEST G
Instrument does not auto-range.	A10, A15 A20	TEST G
Over-range LED or half-range LED is constantly on.	A10, A15 A20	TEST G

6-9

FRONT PANEL KEY - INPUT
GENERAL HEADINGS - CALIBRATION/CAL SIGNAL, AD/DC COUPLING, A WEIGHT FILTER, ICP CUR-RENT SOURCE

Symptom of Failure	Troubleshooting	
	Assemblies	Fault Isolation
Instrument fails in ac coupling only or in dc coupling only.	A10	
Instrument fails only when the A-Weight filter is enabled.	A10	
ICP current source fails.	A10	
Cal signal appears incorrect.	A10, A15	TEST G

FRONT PANEL KEY - LCL, HP-IB BUS OPERATION
FAULT SYMPTOM OF FAILURE ASSEMBLIES ISOLATION

Symptom of Failure	Troubleshooting	
	Assemblies	Fault Isolation
Instrument works properly from the front panel but does not respond to HP-IB commands.	A50, A82 W82	
Instrument works properly with INPUT TRIGGER and EXTERNAL TRIGGER but does not respond to HP-IB TRIGGER.	A50, A82 W82	
Instrument will not drive plotter.	A50, A82 W82	
Noise source output works correctly in Baseband mode, but not in zoom mode.	A50	

FRONT PANEL KEY - FREQ
GENERAL HEADINGS - BASEBAND OPERATION, ZOOM OPERATION, FREQUENCY SPAN

Symptom of Failure	Troubleshooting	
	Assemblies	Fault Isolation
Instrument works properly with a 100 kHz frequency span but not with a frequency span of less than 100 kHz.	A20	TEST F
Instrument works properly in baseband mode (start frequency = 0 Hz) but not in zoom mode (start frequency > 0 Hz or set center).	A50, A20	TEST F
Frequency readings are incorrect.	A40, A20 A15	TEST D

6-10

6-8 FAULT ISOLATION PROCEDURE

WARNING

*Maintenance described herein is performed with power supplied
to the instrument and with the protective covers removed. Review
Paragraph 6-2, "SAFETY CONSIDERATIONS" before performing
the Fault Isolation Procedures.*

CAUTION

*Do not remove circuit assemblies when the -hp-3561A LINE power
switch is ON.*

CAUTION

*The -hp-3561A contains components which may be damaged as
a result of static discharge. Remove circuit assemblies from the
-hp-3561A only at a static protected work station.*

6-9 Using the Fault Isolation Procedure

The fault isolation procedure uses the internal diagnostic test routines and waveform
comparison to isolate a failure to the circuit board level. The fault isolation pro-
cedure should be started with TEST A unless the symptoms of the failure indicate
otherwise (see Paragraph 6-7, "Troubleshooting Guidelines"). Once the fault isolation
procedure is started, the remaining tests should be run in sequence. When a fault
isolation test fails, the test will indicate the assembly which most likely caused the
failure, and the paragraph in Section 7 where troubleshooting can be continued to
the component level. The experienced technician will be able to skip certain tests if
the circuits are obviously working correctly (eg., the display driver tests may be skip-
ped if the display is operational).

The fault isolation procedure does not detect every possible failure. If a failure is
not detected, the performance test (Section 2) can be used to further test the
-hp-3561A.

6-11

NOTE

Except where otherwise noted, oscilloscope waveforms shown in this manual are measured with a 10:1 oscilloscope probe. To obtain the actual signal levels, multiply the volts per division value by ten(10).

NOTE

Some power supply failures may appear to be processor or RAM bus failures. In addition, some of the power supplies provide power to selected components (eg., the +8 Volt supply powers the digital filter only). A failure in one of these supplies may be mistaken for a component failure.

Table 6-4 Fault Isolation Procedure Summary

Test Number	Description	Assemblies Tested
TEST A	Bias Power Supply	A71, A99
TEST B	Main Power Supply	A70, A71, A72, A99
TEST C	Display Driver	A60, A90, A99
TEST D	Processor/ROM	A40, A81
TEST E·	FFT/RAM	A30
TEST F	Digital Filter	A20
TEST G	Digitizer/Input Amplifier	A15, A10
TEST H	Local Oscillator/Noise Source	A50
TEST I	CMOS/Bubble Memory	A65, A66

6-10 TEST A: Bias Power Supply A71, A99

The bias power supply provides power to the main power supply components.

WARNING

±170 Volts are present on the A70 and A71 Assemblies. ±170 Volts are present on the heat sinks on the A70 Assembly. Be extremely careful when working in proximity to this area. The high voltage can cause serious personal injury if contacted.

1. Turn the -hp-3561A LINE power switch ON.

2. Check for +12 ± 0.6 Vdc at test point A71 TP"+12BIAS", and for -12 ± 0.6 Vdc at test point A71 TP"-12BIAS" as shown in Figure 6-2.

3. If the bias supply voltages are incorrect, proceed with troubleshooting the A71 Assembly (Section 7: "Power Supply").

Continue with **TEST B** on Page 6-14 .

Figure 6-2 A71 Component Locator
6-11 TEST B: Main Power Supply A70, A71, A72, A99

WARNING

±170 Volts are present on the A70 and A71 Assemblies. ±170 Volts are present on the heat sinks on the A70 Assembly. Be extremely careful when working in proximity to this area. The high voltage could cause serious personal injury if contacted.

The main power supply is a switching-regulated, +5V logic supply. Several other linear-regulated supply voltages are derived from this "master" +5 Volt supply. Thus, a failure in the +5 Volt logic supply will affect all other power supply voltages. A shut-down protection circuit monitors all of the power supply outputs for an over-voltage, or a primary over-current condition. If a failure is detected, the protection circuit will shut down the power supply and light an LED to indicate the cause of the failure.

Power supplies in the -hp-3561A are divided into two categories: power supplies referenced to the chassis ground, and power supplies referenced to the isolated (or floating) ground. The isolated ground is a completely separate ground derived from the power transformer. All voltages referenced to the isolated ground are marked with an "I" (eg. +15 V$_I$). Voltages referenced to the isolated ground cannot be measured in with respect to the chassis ground unless the front panel ground switch is in the CHASSIS position.

Model 3561A

Fault Isolation

TEST B: Main Power Supply

Protection Circuit Test
1. Move the -hp-3561A front panel ground switch to the CHASSIS position.
2. Turn the -hp-3561A LINE power switch ON.
3. Check the protection circuit LEDs shown in Figure 6-3 for the pass/fail conditions listed.

Pass: All of the protection circuit LEDs are off.

Fail: One or more of the protection circuit LEDs is on.

A72 Power Supply Test
This test determines whether the linear-regulated power supplies are loading down the master +5 V supply.
1. Turn the -hp-3561A LINE power switch OFF.
2. By Removing the A72 Assembly, Disconnect the linear-regulated power supplies on the A99 Assembly from the power transformer on the A71 Assembly.
3. Turn the -hp-3561A LINE power switch ON.
4. Check the protection circuit LEDs shown in Figure 6-3 for the pass/fail conditions listed.
5. Turn the -hp-3561A LINE power switch OFF and re-insert the A72 assembly.

Pass: All of the protection circuit LEDs are off.

Fail: One or more of the protection circuit LEDs is on.

Troubleshoot the A70, A71, A72 Assemblies (Section 7:"Power Supply").

Power Supply Switching Clock Test
The master switching power supply receives its clock from the A20 Assembly. When the A20 Assembly is removed, the power supply will generate its own clock. This test determines whether or not the A20 clock is causing the failure.
1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A20 Assembly.
3. Turn the -hp-3561A LINE power switch ON.
4. Check the protection circuit LEDs shown in Figure 6-3 for the pass/fail conditions listed.
5. Turn the -hp-3561A LINE power switch OFF and re-insert the A20 Assembly.

Pass: All of the protection circuit LEDs are off.

Fail: One or more of the protection circuit LEDs is on.

Troubleshoot the A20 Assembly (Section 7:"Digital Filter").

Power Supply Loading Test
A destination assembly may be loading down the supply or the supply itself may have a failure. Starting with the A10 destination assembly, this test isolates the failure to one of the destination assemblies, or to the power supply.
1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A10 Assembly.

CAUTION
Before removing the A10 Assembly, remove the bottom cover and disconnect the input cable (W10).

3. Turn the -hp-3561A LINE power switch ON.
4. Check the protection circuit LEDs shown in Figure 6-3 for the following conditions.
   If all of the LEDs are off when the A10 Assembly is removed, troubleshoot the A10 Assembly (Section 7:"Input Amplifier")
   If any of the protection circuit LEDs are on, proceed with step 5.
5. Turn the -hp-3561A LINE power switch OFF and re-insert the A10 Assembly.
6. Repeat steps 1 through 5 for the assemblies listed in Table 6-5. Remember to turn the power off before removing each assembly and to re-insert the assembly before proceeding with the next assembly.
Table 6-5 Power Supply Destination Assemblies

Assembly	Proceed With Troubleshooting at:
A15	Section 7:"Digitizer"
A20	Section 7:"Digital Filter"
A30	Section 7:"FFT/RAM"
A40 (and A30*)	Section 7:"Processor/ROM"
A50	Section 7:"Local Oscillator/Noise Source"
A60	Section 7:"Digital Display Driver"
A64/A65	Section 7:"CRT/Disable"
A90	Section 7:"Analog Display Driver"

* NOTE
The A20 Assembly must be removed whenever the A40 assembly is removed. If the A40 Assembly is not removed, the power supply protection circuit may turn the power supply off with a primary over-current failure. This occurs because the power supply clock is generated on the A20 Assembly by dividing down the A40 Assembly 20.48 MHz clock.

NOTE
The failure may also reside on the Keyboard Assembly (A81) at the Rear Panel Assembly (A82). Because access to these two assemblies is difficult and because failures are rare, it is recommended that troubleshooting be completed on the power supply in Section 7 before resting these two assemblies. Refer to Section 7 for instructions on removing the front panel.

Fail: After all of the destination assemblies have been tested one or more of the protection circuit LEDs remain on.

Troubleshoot the A70, A71, A72 Assemblies (Section 7:"Power Supply").

Pass: Removing one of the assemblies causes the protection circuit LEDs to all turn off.

Troubleshoot the assembly which, when removed, eliminates the failure.

+5 V Logic Power Supply Test
1. Turn the -hp-3561A LINE power switch ON.
2. Use a voltmeter to check the +5 V supply at test point A71 TP +5 V as shown in figure 6-4.

Pass: +5.0 Volts ≤ A71 TP +5 ≤ +5.3 Volts

Fail: +5 V supply is incorrect

Troubleshoot the A70, A71, A72 Assemblies (Section 7:"Power Supply").

+24 ±0.12 V	A99 U200Output	A10
+15 ±0.75 V	A99 U301Output	A10, A15
+5 ±0.25 V$_A$	A99 U204Output	A15
+5 ±0.25 V$_B$	A99 U205Output	A10
-15 ±0.75 V	A99 U300Output	A10, A15

Pass: All of the voltages are correct.

Fail: One or more of the voltage is incorrect.

Isolated Ground Power Supply Loading Test

A destination assembly may be loading down the supply or the supply itself may have a failure. Starting with the A10 Assembly, this test isolates the failure to one of the destination assemblies, or to the power supply.

CAUTION
Before removing the A10 Assembly, remove the bottom cover and disconnect the input cable (W16).

1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A10 Assembly.
3. Turn the -hp-3561A LINE power switch ON.
4. Check the isolated ground power supply voltages listed in Table 6-8.

If the voltages are correct, troubleshoot the A10 Assembly (Section 7-"Input Amplifier").

If one or more of the voltages is incorrect, proceed with step 5.

5. Turn the -hp-3561A LINE power switch OFF. If the voltage is correct when the A15 Assembly is removed. Troubleshoot the A15 Assembly (Section 7-"Digitizer").
6. Repeat steps 1 through 5 for the A15 Assembly.

Pass: Removing one of the destination assemblies corrects the voltage.

→ Troubleshoot the destination assembly, which, when removed, corrects the voltage.

Fail: After the A10 and A15 Assemblies have both been tested one or more of the voltages remain incorrect.

→ Troubleshoot the A70, A71, A72 Assemblies (Section 7-"Power Supply").

Chassis Ground Power Supply Test

1. Move the front panel ground switch to the CHASSIS position.
2. Turn the -hp-3561A LINE power switch ON.
3. Use a voltmeter to check all of the chassis ground power supply voltages listed in Table 6-6. The test point for each voltage is shown in Figure 6-5.

Table 6-6 Chassis Ground Power Supply Voltages

Voltage	Test Location	Destination Assemblies
+12 ± 0.5 V$_A$	A99 U201Output	A15, A20, A40, A50, A60/A65
+8 ± 0.4 V	A99 U203Output	A20
-12 ± 0.6 V	A99 U202Output	A20, A50, A90

Pass: All of the voltages are correct.

Fail: One or more of the voltages is incorrect.

Chassis Ground Power Supply Loading Test

A destination assembly may be loading down the supply or the supply itself may have a failure. Starting with the A20 Assembly, this test isolates the failure to one of the destination assemblies, or to the power supply.

1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A20 Assembly.
3. Turn the -hp-3561A LINE power switch ON.
4. Check the chassis ground power supply voltages listed in Table 6-6.

If the voltages are correct, troubleshoot the A20 Assembly (Section 7-"Digital Filter").

If one or more of the voltages is incorrect, proceed with step 5.

5. Turn the -hp-3561A LINE power switch OFF and reinsert the A20 Assembly.
6. Repeat steps 1 through 5 for the remaining destination assemblies listed in Table 6-7. Remember to turn the power off before removing each assembly and to reinsert the power of before proceeding with the next assembly.

Table 6-7 Chassis Ground Power Supply Destination Assemblies

Voltage	Destination Assemblies	Proceed With Troubleshooting at:
+12 ± 0.6 V	A15	Section 7-"Digitizer"
	A40 and A20*	Section 7-"Processor/ROM"
	A50	Section 7-"Local Oscillator/Noise Source"
		Section 7-"CMOS/Bubble Memory"
	A60/A65	Section 7-"Local Oscillator/Noise Source"
	A90	Section 7-"Analog Display Driver"
-12 ± 0.6 V		

*NOTE
The A20 Assembly must be removed whenever the A40 assembly is removed. If the A20 Assembly is not removed, the power supply protection circuit may turn the power supply off with a primary overcurrent failure. This occurs because the power supply clock is generated on the A20 Assembly by dividing down the A40 Assembly 20.48 MHz clock.

NOTE
The Rear Panel Assembly (A82) may also be loading down the -12 V supply. Because access to the A82 Assembly is difficult and because failures are rare, it is recommended that troubleshooting be completed on the power supply in Section 7 before testing the A82 Assembly.

Pass: Removing one of the destination assemblies corrects the voltage.

→ Troubleshoot the destination assembly, which, when removed, corrects the voltage.

Fail: After all of the destination assemblies have been tested one or more of the voltages remain incorrect.

→ Troubleshoot the A70, A71, A72 Assemblies (Section 7-"Power Supply").

TEST B (Continued)

+12 V$_A$ Power Supply Test

The +12 V$_A$ supply provides power to circuits on the A90 and A99 Assemblies only.

1. Turn the -hp-3561A LINE power switch ON.
2. Use a voltmeter to check the +12 V$_A$ supply for +12 ± 0.6 V at the "+12 DISC" jumper as shown in Figure 6-5.

Pass: +11.4 Volts ≤ +12 V$_A$ ≤ +12.6 Volts

Fail: The +12 V$_A$ supply is incorrect.

+12 V$_A$ Supply Loading Test

The destination assemblies (A90, A99) may be loading down the supply or the supply itself may have a failure. This test isolates the failure to either the destination circuits, or the power supply.

1. Turn the -hp-3561A LINE power switch OFF.
2. Disconnect one end of the "+12 DISC" jumper on the A99 Assembly.
3. Turn the -hp-3561A LINE power switch ON.
4. Check the +12 V$_A$ supply for +12 ± 0.6 V.
5. Turn the -hp-3561A LINE power switch OFF and resolder the "+12 DISC" jumper into the A99 Assembly.

Pass: +11.4 Volts ≤ +12 V$_A$ ≤ +12.6 Volts

→ Troubleshoot the A90, A99 Assemblies (Section 7-"Analog Display Driver").

Fail: +12 V$_A$ supply is incorrect.

→ Troubleshoot the A70, A71, A72 Assemblies (Section 7-"Power Supply").

Pass: All of the voltages are correct.

TEST B Complete.
Continue with TEST C

6-17/6-18

6-12 TEST C: Display Driver A60, A90, A99

WARNING

+450 Volts and -150 Volts are present on the A90 and A99 Assemblies. Be extremely careful when working in proximity to this area. The high voltage could cause serious personal injury if contacted.

The -hp-3561A display driver is divided into two circuit assemblies, the digital display driver (A60), and the analog display driver (A90). The digital display driver receives display data directly from the central processor. It then reformats the data into the CRT video drive, horizontal sweep, and vertical sweep signals. The analog display driver converts these signals into the actual analog CRT drive signals.

Figure 6-6 -hp-3561A CRT Test Pattern
TEST C: Display Driver

Display Test

1. Turn the -hp-3561A LINE power switch ON.
2. Move the A60 Assembly test jumper J100 to the PLANE2 (half bright) position as shown in Figure 6-7.
3. Check the -hp-3561A CRT screen for the display shown in Figure 6-6. Check for brightness, alignment, size, focus, and vibration of the pattern.
4. Move the A60 Assembly test jumper J100 to the PLANE1 (full bright) position as shown in Figure 6-7.
5. Check the -hp-3561A CRT screen for the display shown in Figure 6-6. The pattern should be brighter than the PLANE2 pattern. Check for brightness, alignment, size, focus, and vibration of the pattern.
6. If both display patterns are correct, move test jumper A60 J100 back to the RUN position, and press the -hp-3561A front panel PRESET key.

Pass: Both CRT patterns are correct.

TEST C Complete.
Continue with
TEST D

Fail: One or both CRT patterns are incorrect.

Digital Display Driver

1. Move the A60 Assembly test jumper J100 to the PLANE2 (half bright) position as shown in Figure 6-7, and use an oscilloscope to check for the waveforms shown in Figure 6-8.
2. Move the A60 Assembly test jumper J100 to the PLANE1 (full bright) position as shown in Figure 6-7, and use an oscilloscope to check for the waveforms shown in Figure 6-9.
3. Move the A60 Assembly test jumper J100 back to the RUN position and press the front panel PRESET key.

Pass: All of the waveforms are correct

Troubleshoot the A90, A99 Assemblies (Section 7, "Analog Display Driver")

Fail: One or more of the waveforms is incorrect.

Troubleshoot the A60 Assembly (Section 7, "Digital Display Driver")

6-13 TEST D: Processor/ROM A40

The A40 Assembly contains the central processor, ROM, and the master 20.48 MHz clock. Failures on the A40 Assembly will usually result in the instrument not completing its power up routine, or in a power on test return code. This test gives a high probability of isolating the failure, but does not exhaust all possible failures. If a bus failure is suspected which is not isolated by this routine, a more complete bus test using signature analysis is given in the "Processor/ROM" paragraph of Section 7.

When the power is turned on, the main processor will perform diagnostic self tests 0 and 1. For more information on these tests, refer to Paragraph 6-18 "Diagnostic/Self-Test Descriptions."

DISPLAY ACTIVITY DURING POWER ON TEST

When power is first applied, the message "POWER ON TEST IN PROGRESS" is displayed at the top of the CRT screen for approximately three seconds (for approximately one second when the A30 Assembly is removed). A test pattern is then displayed and erased, which requires approximately three seconds. When the display pattern is completely erased, the "POWER ON TEST IN PROGRESS" message is again displayed at the top of the CRT screen for approximately two seconds. The power on test is then complete and initiates the measurement display if no failures are encountered, or displays a return code for each failure encountered.

FRONT PANEL LED ACTIVITY DURING POWER ON TEST

When power is first applied, all of the front panel LEDs turn on for approximately three seconds (for approximately one second when the A30 Assembly is removed). The LEDs then turn off for approximately three seconds while the test pattern is being displayed and erased on the CRT. The LEDs then turn on for approximately two more seconds. The power on test is then complete and initiates normal measurement operation if no failures are encountered or displays a return code on the LEDs for the failures encountered. The front panel LED return code descriptions are given in Figure 6-10.

SUMMARY OF TEST 0 RETURN CODES

Processor Failures (A40)
0 3 25
0 8 01 through **0 8 24**

RAM Failures (A30)
0 7 26
0 3 27
0 7 31

Interupt Failure (A40)
0 2 30

Display Failures (A60)
0 7 28
0 3 29

Figure 6-10 Front Panel LED Return Codes

Example:

EXT SAMP	-ON	16
AVG	-OFF	0
TIME BUFFER	-OFF	0
MEAS	-ON	2
TRIG	-OFF	0
	Return Code =	18

LED	Description
EXT SAMP	Has a value of 16 in the return code when turned on.
AVG	Has a value of 8 in the return code when turned on.
TIME BUFFER	Has a value of 4 in the return code when turned on.
MEAS	Has a value of 2 in the return code when turned on.
TRIG	Has a value of 1 in the return code when turned on.
ARM	More than one failure occured during the power on test.
RMT	An A40 Assembly failure occured during the power on test.
SRQ	An A60 Assembly failure occured during the power on test.
LTN	An A30 Assembly failure occured during the power on test.

Fault Isolation

**TEST D:
Processor/RCM**

TEST D: Power-On Test
Turn the -hp-3561A LINE power switch ON. Check the results of the power on test for the pass/fail conditions listed.

Fail: The power on test does not complete, or the power on test completes and indicates a failure on more than one assembly.

Fail: The power on test completes and indicates an interrupt failure only (0 3 30).

Fail: The power on test completes and indicates a display failure (0 7 2B, or 0 3 29), but no RAM failures or processor failures.

Fail: The power on test completes and indicates a processor failure (0 8 01 through 0 8 24, or 0 3 25), but no RAM failures or display failures.

Troubleshoot the A40 Assembly (Section 7-"Processor/ROM").
TEST D Continued
on next page.
(Power On Test Cont'd)

General Bus Fault Test

These failures can be caused by an assembly loading down the processor address or data bus. Starting with the A66/A65 Assembly, this test isolates the failure to an assembly loading down the processor address or data bus, or to the A40 Assembly.

1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A66/A65 Assembly.
3. Turn the -hp-3561A LINE power switch ON and check for the following conditions.

If the power on test completes with no test 0 return codes, troubleshoot the A66/A65 Assembly (Section 7-"CMOS/Bubble Memory").

If the power on test does not complete, or completes and indicates a failure on more than one assembly, continue with step 4.

4. Turn the -hp-3561A LINE power switch OFF, and re-insert the A66/A65 Assembly.
5. Repeat steps 1 through 4 for the assemblies listed in Table 6-9. When the A30 Assembly is removed, only return code (0 3 28) should occur.

Table 6-9 Processor Bus Fault Assemblies

Assembly	Pass conditions	Proceed With Troubleshooting at:
A20 A50	no test 0 return codes no test 0 return codes	Section 7-"Digital Filter" Section 7-"Local Oscillator/Noise Source"
A30	return code (0 3 27) only	Section 7-"FFT/RAM"
A60	return code (0 3 28) only	Section 7-"Digital Display Driver"

NOTE
The following LEDs are on for return code (0 3 28): L7A, TIME BUFFER, AVC, EET SAMP. All other LEDs should be off.

NOTE
The Keyboard Assembly (A81) may also be loading down the processor address or data bus. Because access to the A81 Assembly is difficult and because failures are rare, it is recommended that troubleshooting be completed on the A40 Assembly in Section 7 before testing the A81 Assembly. Refer to Section 7 for instructions on removing the front panel.

Fail: After all of the assemblies listed in Table 6-9 have been tested the power on test still does not complete, or completes and indicates a failure on more than one assembly.

Troubleshoot the A40 Assembly (Section 7-"Processor/RAM").

Pass: The power on test completes with no test 0 return codes when one of the assemblies is removed.

Troubleshoot the assembly, which, when removed, eliminates the return code.

Interrupt Test

Starting with the A66/A65 Assembly, this test checks for assemblies interrupting the processor:

1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A66/A65 Assembly.
3. Turn the -hp-3561A LINE power switch ON and check for the following conditions.

If the power on test completes with no test 0 return codes, troubleshoot the A66/A65 Assembly (Section 7-"CMOS/Bubble Memory").

If the power on test fails with return code (0 2 30), continue with step 4.

4. Turn the -hp-3561A LINE power switch OFF and re-insert the A66/A65 Assembly.
5. Repeat steps 1 through 4 for the assemblies listed in Table 6-10. When the A30 Assembly is removed, only return code (0 3 27) should occur.

Table 6-10 Interrupt Test Assemblies

Assembly	Pass Condition	Proceed With Troubleshooting at:
A20 A50	no test 0 return code/no return code (0 3 27) only	Section 7-"Digital Filter" Section 7-"FFT/RAM"
A30	no test 0 return codes	Section 7-"Local Oscillator/Noise Source"

Fail: After all of the assemblies listed in Table 6-10 have been tested the power on test continues to fail with return code (0 2 30).

Troubleshoot the A40 Assembly (Section 7-"Processor/ROM").

Pass: The power on test completes with no test 0 return codes when one of the assemblies is removed.

Troubleshoot the assembly, which, when removed, eliminates the return code.

Display Handshake Test

1. Turn the -hp-3561A LINE power switch OFF.
2. Place the A40 Assembly on an extender board and remove the A60 Assembly.
3. Move test jumpers A40W1 and A40W3 to the test position as shown in Figure 6-11.
4. Turn the -hp-3561A LINE power switch ON. When the front panel LEDs begin to blink (approximately 10 sec.) check the DSFS signal at A40U504(12) for the waveform shown in Figure 6-12. The test point location is shown in Figure 6-11.
5. Turn the -hp-3561A LINE power switch OFF, move jumpers A40W1 and A40W3 to the normal position, and re-insert the A66 and A40 Assemblies.

Pass: The DSFS waveform is correct.

Troubleshoot the A60 Assembly (Section 7-"Digital Display Driver").

Fail: The DSFS waveform is incorrect.

Troubleshoot the A40 Assembly (Section 7-"Processor/ROM").

TEST D Continued

Power Up Test

Turn the -hp-3561A LINE power switch ON
and check the results of the power up test
for the pass/fail conditions listed.

Fail: The power on test completes and indicates a RAM failure
(0.7 26, 0.3 27, 0.7 31), but no display failure or processor failures.

Pass: The power on test completes with no test 0 return codes (return codes
in the form of "0.X.XX").

RAM Bus Loading Test

1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A20 Assembly.
3. Turn the -hp-3561A LINE power switch ON and check for the pass/fail conditions listed.
4. Turn the -hp-3561A LINE power switch OFF and re-insert the A20 Assembly.

Fail: The power on test completes, and indicates a RAM failure
(0.3 27, 0.7 26, or 0.7 31).

Pass: The power on test completes with no test 0 return codes.

Troubleshoot the A20 Assembly (Section 7-"Digital Filter").

RAM Handshake Test

1. Turn the -hp-3561A LINE power switch OFF.
2. Place the A40 Assembly on an extender board and remove the A30 Assembly.
3. Using a clip lead, connect the PRC signal (A40TP400) to +5 V. Move test jumpers A40W1 and A40W3 to the test position as shown in Figure 6-13.
4. Turn the -hp-3561A LINE power switch ON. When the "BLT TEST ROUTINE" (blinking light test) message is displayed on the CRT screen, check the waveforms shown in Figure 6-15. The test point locations are shown in Figure 6-13.
5. Turn the -hp-3561A LINE power switch OFF, move jumpers A40W1 and A40W3 back to the run position, remove the clip lead from A40TP406, and re-insert the A30 and A40 Assemblies.

Fail: One or more of the signals is incorrect.

Pass: All of the signals are correct.

Troubleshoot the A40 Assembly (Section 7-"Processor/ROM").

Troubleshoot the A30 Assembly (Section 7-"FFT/RAM").

20.48 MHz Clock Test

Turn the -hp-3561A LINE power switch ON. Use an oscilloscope to check for the 20.48 MHz clock waveform at test point A40TP100 as shown in Figure 6-14. The test point location is shown in Figure 6-13.

Fail: The 20.48 MHz waveform is incorrect.

Pass: The 20.48 MHz waveform is correct.

Troubleshoot the A40 Assembly (Section 7-"Processor/ROM").

TEST D Complete.
Continue with TEST E
FFT/RAM TEST.

6-14 TEST E: FFT/RAM A30

The A30 Assembly contains the instrument RAM and the FFT Processor. The FFT processor is a separate microprocessor with its own ROM and an asynchronous clock. This test uses the power up test and self test 12 to verify proper operation of the A30 Assembly.

Fault Isolation

**Figure 6-16. A40 Component Locator**

Figure 6-17. A30 Component Locator

Figure 6-18. RAM Bus Arbitrator Waveforms

RAM Bus Arbitrator Test

These return codes usually indicate a failure on the A10, A15, or A20 Assemblies but may be caused by the RAM bus arbitrator.

1. Turn the hp-3561A LINE power switch OFF.
2. Remove the A30 Assembly and place the A30 Assembly on an extender board. Short the two pins of jumper A30W100 together.
3. Move the A40 Assembly test jumpers A40W1 and A40W3 to the test position as shown in Figure 6-16.
4. Turn the hp-3561A LINE power switch ON.
5. When the "RLT TEST ROUTINE" (blinking light test) message is displayed on the CRT screen, check the signals listed in Table 6-11. The signal test points are shown in Figure 6-17.

Table 6-11 RAM Bus Arbitrator Signals

Signal Name	Test Point	State
FFT8R	U70(3)	TTL high
DF38R	TFF04	TTL high
DF28R	TFF06	TTL high
DF18R	U70(99)	TTL high
DF38C	TFF00	TTL high
DF28C	TFF01	TTL high
DF18C	TFF02	TTL high

6. If all of the signals given in Table 6-11 are correct, use a clip lead to short DF38R (A30TFF04) to ground. Check the DF38C signal at A30TFF00 to see the waveform shown in Figure 6-18. The test point locations are shown in Figure 6-17.
7. If DF38C is correct, remove the short from DF38R and short DF28R (A30TFF06) to ground. Check the DF28C signal at A30TFF01 for the waveform shown in Figure 6-18. The test point locations are shown in Figure 6-17.
8. If DF28C is correct, remove the short from DF28R and short DF18R (A30U70(99)) to ground. Check the DF18C signal at A30TFF02 waveform shown in Figure 6-18. The test point locations are shown in Figure 6-17.
9. Turn the hp-3561A LINE power switch OFF. Remove the clip lead from DF18R and move jumpers A40W1 and A40W3 back to the RUN position as shown in Figure 6-16. Remove the clip lead from jumper A30W100.
10. Turn the hp-3561A LINE power switch ON. When the power-on test is complete, set the controls as follows:

PRESET ....TEST SELECT...DEFINE TEST NUM...121 ENTER
MODE ....START CONT TST

11. Check the BIOS signal at A30TFF00? for the waveforms shown in Figure 6-18. The test point locations are shown in Figure 6-17.
12. Turn the hp-3561A LINE power switch OFF and re-insert the A20 and A30 Assemblies.

Fail: One or more of the signals is incorrect.
Troubleshoot the A30 Assembly (Section 7 "A30").

Pass: All of the signals are correct.

TEST B: FFTRAM

Power On Test
Turn the hp-3561A LINE power switch ON. Check the results of the power-on test for the prestal conditions listed.

Fail: The power on test does not complete or completes with one or more test 0 return codes (n-num codes of the format "0 X XX").
Proceed with fault isolation TEST 0: "ProcessorROM" on page 6-25/6-26.

Fail: The power on test completes with a digital filter or input section return code (11 00, 11 01, 11 30, 12 00, 12 02, or 15 00).
Troubleshoot the A30 Assembly (Section 7 "FFTRAM").

Fail: The power on test completes with an FFT return code (11 2 02, or 15 01).

Fail: The power on test completes with a measurement data return code (16 00 through 16 04).

Pass: The power on test completes with no return codes.

These return codes usually indicate a failure on the A10, A15, or A20 Assemblies. Continue with TEST E.

TEST E Continued on next page

TEST E (Continued)

Self Test 12

1. Set the -hp-3561A controls as follows:

PRESET
MODE ... TEST SELECT ... DEFINE TEST NUM ... 12 ENTER
START SNGL TST

2. When the "TEST #12 IS COMPLETE" message is displayed, check for the pass/fail conditions listed.
3. Press the -hp-3561A PRESET key.

Pass: Self test 12 completes with no return codes.

TEST E Complete.
Continue with
TEST F

Fail: Self test 12 completes with one or more return codes.

RAM Bus Loading Test

1. Turn the -hp-3561A LINE power switch OFF.
2. Remove the A20 Assembly.
3. Turn the -hp-3561A LINE power switch ON and set the -hp-3561A controls as follows:

PRESET
MODE ... TEST SELECT ... DEFINE TEST NUM ... 12 ENTER
START SNGL TST

5. When the "TEST #12 IS COMPLETE" message is displayed, check for the pass/fail conditions listed.
6. Turn the -hp-3561A LINE power switch OFF, and re-insert the A20 Assembly.

Pass: Self test 12 completes with no return codes.

Troubleshoot the A20 Assembly (Section 7, "Digital Filter").

Fail: Self test 12 completes with one or more return codes.

Troubleshoot the A30 Assembly (Section 7, "FFT/RAM").

6-15 TEST F: Digital Filter A20

The A20 Assembly contains the digital filters, DMA address counters, main trigger
counter, and phase counter. The digital filters receive data from the A15 Assembly
and the A50 Assembly. The processed data is then transferred to the main RAM on
the A30 Assembly. This test uses self tests 13, 14, and 18 to verify correct operation
of the A20 Assembly and assumes proper operation of the A30 Assembly.

TEST F: DIGITAL FILTER

Self Tests #13, #14, and #18

1. Set the -hp-3561A controls as follows:

PRESET
MODE . . . . TEST SELECT . . . . DEFINE TEST NUM . . . . 13 ENTER
START SNGL TST

2. When the "TEST #13 IS COMPLETE" message is displayed, check for

3. Set the -hp-3561A controls as follows:

DEFINE TEST NUM . . . . 14 ENTER
START SNGL TST

4. When the "TEST #14 IS COMPLETE" message is displayed, check for return codes.

5. Set the -hp-3561A controls as follows:

DEFINE TEST NUM . . . . 18 ENTER
START SNGL TST

6. When the "TEST #18 IS COMPLETE" message is displayed, check for return codes.

Fail: Self tests #13, #14, or #18
complete with one or more return codes.

Troubleshoot the A20 Assembly
(Section 7: "Digital Filter")

Pass: Self tests #13, #14, and #18
all complete with no return codes.

A20 I/O Signal Test

1. Turn the -hp-3561A LINE power switch OFF.
2. Place the A20 Assembly on an extender board and remove the A50 and A15 Assemblies.
3. Turn the -hp-3561A LINE power switch ON.
4. Set the -hp-3561A controls as follows:

PRESET
MODE . . . TEST SELECT . . DEFINE TEST NUM . . .122 ENTER
START CONT TEST

5. Check the following signals as shown in Figure 6-20. The signal test point locations are shown in Figure 6-19

Signal Name	Test Point
10 MHz	A20TP302
CONVERT	A20TP100
DATAREQ	A20TP501
SYNC2	A20TP101

6. Set the -hp-3561A controls as follows:

PRESET
INPUT . . . . CAL SIG ON
FREQuency . . . . . . DEFINE CENTER . . . . .50 kHz

7. Check the following signals as shown in Figure 6-20. The signal test point locations are shown in Figure 6-19.

Signal Name	Test Point
ESR*4	A20TP701
FE CAL	A20TP502
ZPHTRIG	A20U702(2)

8. Turn the -hp-3561A LINE power switch OFF and re-insert the A15, A20, and A50 Assemblies

Pass: All A20 I/O signals are correct

TEST F Complete
Continue with **TEST G.**

Fail: One or more of the A20 I/O signals is incorrect.

Troubleshoot the A20 Assembly (Section 7: "Digital Filter").

6-37/6-38
6-16 TEST G: Input Amplifier/Digitizer A10, A15

The A10 Assembly contains the input amplifiers and attenuators used to set the instrument range. The A15 Assembly contains the 100 kHz low pass anti-alias filter, the A/D converter, the trigger level comparators, and the overload/underload comparators.

The central processor controls the A10 and A15 Assemblies through the front end control latch on the A20 Assembly. Programming data is passed first through the A10 Assembly, and then to the A15 Assembly. Thus, the A10 Assembly must be installed for the A15 Assembly to operate.

Test G does not check for distortion failures. To isolate known distortion failures between the A10 Assembly and the A15 Assembly, refer to the A10 Assembly troubleshooting information given in Section 7 (Section 7:"Input Amplifier").

6-17 TEST H: Local Oscillator/Noise Source A50

6-.5

The A50 Assembly contains the noise source, the HP-IB interface, and the local oscillator circuits.

The noise source provides three types of noise outputs; random, periodic, and impulse. When the periodic source is selected, the "SOURCE SYNC" rear panel output provides a trigger pulse. If problems are encountered with the noise source, and the A20 I/O signal test passed, the failure is most likely on the A50 Assembly. Troubleshoot the A50 Assembly noise source circuit (Section 7:"Local Oscillator/Noise Source").

The HP-IB circuit provides an interface between the central processor and the rear panel HP-IB connector. If problems are encountered during HP-IB operation only, troubleshoot the A50 Assembly HP-IB circuit (Section 7:"Local Oscillator/Noise Source").

The local oscillator provides a digital sine wave to both the digital filter and the noise source. The local oscillator frequency is set equal to the center frequency when the -hp-3561A is operated in "zoom" mode (when the start frequency is set to greater than 0 Hz or the "SET CENTER" softkey is used). For a more complete test of the local oscillator refer to the "Local Oscillator/Noise Source" paragraph in Section 7.

NOTE
If the -hp-3561A passes the local oscillator test but does not operate correctly in "zoom" mode, the most likely cause of the failure is the data latch or the digital filters on the A20 Assembly (Section 7:"Digital Filter")

Figure 6-22 8 kHz Sine Wave

TEST G: Input Amplifier/Digitizer

Input Signal Test

NOTE

This test can be repeated at any -hp-3561A range setting. The waveforms given in Figure 6-23 are valid as long as the amplitude of the input line wave is equal to the -hp-3561A range setting.

Connect the frequency synthesizer output to the -hp-3561A front panel input through a 50 Ω feedthrough termination as shown in Figure 6-21.

Set the frequency synthesizer controls as follows:

Frequency .... 8 kHz
Amplitude .... .1 Vrms (0.dBV)
Function .... Sine Wave

Set the -hp-3561A controls as follows:

PRESET
RANGE .... DEFINE RANGE 0.dBV
TRIGger SELect TRIGGER
INPUT TRIGGER ...... DEFINE % OF RNC: 50 %
SETUP SELECT .... SLOPE POS

Mark/off .... DEFINE MKR POS .... 8 kHz

The -hp-3561A CRT screen should appear as shown in Figure 6-22. The front panel "OVER" LED should be off, the "TRIG" and "HALF" LEDs should be blinking, and the "ARM" and "HALF" LEDs should be on.

Pass: The -hp-3561A display and front panel LEDs are correct.

TEST G Complete.
Continue with TEST H

Fail: The -hp-3561A display or front panel LEDs are incorrect.

A10 Output Signal Test

1. Do not change the frequency synthesizer or the -hp-3561A controls or connections.
2. Use an oscilloscope to check the waveforms shown in Figure 6-23.
3. The signal test locations are shown in Figure 6-24.
4. Check the voltage at the A15 Assembly test point TP"TRIG LVL" for 64 ± .06 Vdc.

Fail: One of the signals or the trigger level voltage is incorrect.

Troubleshoot the A10 Assembly (Section 7 "Input Amplifier").

Pass: Both of the signals and the trigger level voltage are correct.

TEST G Continued
on next page.

TEST G (Continued)

A15 Programming Test

1. Set the -hp-3561A controls as follows:

   PRESET
   MODE . . . . TEST SELECT . . . . DEFINE TEST NUM . 110 ENTER
                                                          START CONT TST

2. Use an oscilloscope to check the waveforms given in Figure 6-27.
   The test point locations are given in Figure 6-26.
3. Press the -hp-3561A PRESET key.

Pass: All of the A20 programming signals are correct.

Troubleshoot the A15 Assembly (Section 7:"Digitizer").

Fail: One or more of the A15 programming signals is incorrect.

A20 Programming Test

1. Turn the -hp-3561A LINE power switch OFF.
2. Place the A20 Assembly on an extender board, and remove the A10
   Assembly.

   ⌇CAUTION⌇

   Before removing the A10 Assembly, remove the bottom cover and
   disconnect the the input cable (W10).

3. Turn the -hp-3561A LINE power switch ON and set the controls as
   follows:

   PRESET
   MODE . . . . TEST SELECT . . . . DEFINE TEST NUM . 110 ENTER
                                                          START CONT TEST

4. Use an oscilloscope to check the waveforms given in Figure 6-28.
   The test point locations are given in Figure 6-25.
5. Press the -hp-3561A PRESET key.

Fail: One or more of the A20 programming signals is incorrect.

Troubleshoot the A20 Assembly (Section 7:"Digital Filter").

Pass: All of the A15 programming signals are correct.

Troubleshoot the A10 Assembly (Section 7:"Input Amplifier").

TEST H: Local Oscillator/Noise Source

Local Oscillator Test

In this test, the noise source circuitry is used to output the local oscillator signal. The noise source output is checked first to verify the signal path, then self test 151 is used output the local oscillator signal.

1. Connect the -hp-3561A rear panel "SOURCE OUT" output to the 3561's front panel BNC connector.

2. Set the -hp-3561A controls as follows:

PRESET
WINDOW ...... UNIFORM
SOURCE ...... PERIODIC NOISE
            DEFINE ATTEN .... 0 dB
TRIGger SELect TRIGGER
            SOURCE TRIGGER

3. The -hp-3561A display should appear as shown in Figure 6-29. This verifies that the noise source signal path is operational. The marker should read -23 dBV ± 1.5 dB at 50 kHz.

4. Set the -hp-3561A controls as follows:

PRESET
MODE .... TEST SELECT .... DEFINE TEST NUM .151 ENTER
                                START CONT TST

5. Use an oscilloscope to check the local oscillator signal at the "SOURCE OUT" rear panel connector. The sine wave should appear as shown in Figure 6-30.

Fail: The local oscillator Sine wave is incorrect.

Troubleshoot the A50 Assembly (Section 7:"Local Oscillator/Noise Source").

Pass: The local oscillator sine wave is correct.

TEST H Complete.
Continue with
TEST I

6-18 TEST 1 CMOS/Bubble Memory A65, A66

Every instrument is equipped with either an A65 or an A66 Assembly. The A65 Assembly contains CMOS and bubble memory; the A66 Assembly contains only CMOS memory. Use the bubble memory test only if the instrument under test is equipped with an A65 Assembly.

{CAUTION}

Removing power, or turning the LINE power switch OFF while self test 20 is running, could result in permanent damage to the bubble memory.

CMOS Memory Test

1. Set the -hp-3561A controls as follows:

PRESET
MODE . . . . TEST SELECT . . . . DEFINE TEST NUM . . . 19 ENTER
                                                                 START SNGL TST

2. The test should complete with no return codes. If any return codes are given, troubleshoot the CMOS memory on the A66/65 Assembly (Section 7:"CMOS/Bubble Memory").

Bubble Memory Test

1. Set the -hp-3561A controls as follows:

PRESET
MODE . . . . TEST SELECT . . . . DEFINE TEST NUM . . . 20 ENTER
                                                                 START SNGL TST

2. The test should complete with no return codes. If any return codes are given, troubleshoot the bubble memory on the A65 Assembly (Section 7:"CMOS/Bubble Memory").

6-19 DIAGNOSTIC/SELF-TEST DESCRIPTIONS

6-20 Introduction

NOTE

The following information documents the meaning of the diagnostics and their Error Return Codes. If the -hp-3561A displays an Error Return Code during power-on or operation, refer to the Fault Isolation information in the front of this section for failure identification.

The -hp-3561A has many built-in diagnostic routines. These diagnostic routines are used during instrument power-up, adjustments and troubleshooting. There are four types of test routines which are identified by their test number as follows:

Power-On Routine   Number 0

This routine is only performed on power-on or if the 68000 CPU IC reset line is activated (manually by the technician or automatically by the Low-Line monitor circuit in the Power Supply). Test 1 is also executed as part of the power-on routine.

Functional Routines   Numbers 1 through 49

In these test routines, the processor tests and verifies the results of the tests. Test failures will be indicated on the CRT.

Adjustment Routines   Numbers 50 through 99

In these test routines, the instrument is programmed to make a measurement and display the resultant data on the CRT.

Service Tests   Numbers 100 and up

In these test routines, specific instrument circuits are set to defined conditions which are then verified by external equipment. For example, a circuit can be stimulated or set-up so that digital signature analysis or oscilloscope timing waveforms can be observed. The processor does not verify the results of the setups.

All of the test routines depend on the proper operation of the Processor/ROM (A40), Power Supply (A70,A71,A72 and A99), the Display (A60 and A90) and the Front Panel Keyboard (A80 and A81) except for the power up routine Test #0. The power up routine depends on proper operation of the power Supply, Processor/ROM and either the Display or the Front Panel.

Note that even though there are tests with numbers greater than 100, there are only 34 test routines in the instrument. These 34 test routines and their names are listed in Table 6-12 and described in paragraphs 6-23 through 6-51.

Table 6-12 -hp-3561A Diagnostic/Self Tests

Test Number	Description
0	Power-On Test: Only run at power-on or when the microprocessor reset input is activated. This test checks the processor and its support circuitry. The routine cannot be initiated from the front panel.
1	Quick Functional Test: causes the -hp-3561A to make one measurement and verify the result. Test 1 is automatically run after Test 0 as part of the power-on routine.
12	Test 12 tests the FFT circuitry on the A30 FFT/RAM Assembly. The processor initiates the FFT circuits to perform a transform on fixed data and then checks the result.
13	A20 Timing Counter Test: Checks the operation of the Timing Counter IC and its support circuitry. Both circuits are located on the A20 Assembly.
14	Digital Filter/DMA Channel R Test: Used to test the Digital Filter and Channel R DMA Address Counter circuits on the A20 Digital Filter Assembly.
18	DMA Channel G/ Trigger Test: Used to test the Channel G DMA Address Counter and Trigger circuits on the A20 Digital Filter Assembly.
19	CMOS Memory Test: Writes and reads a known pattern to the A66 CMOS Memory Assembly to check the CMOS memory IC. This test is also used to check the CMOS memory IC on the optional A65 CMOS/Bubble Memory Assembly
20	Bubble Memory Test: Writes and reads a known pattern to the A65 CMOS/Bubble Memory Assembly to check the Bubble Memory module. Note: Bubble Memory is an option for the -hp-3561A.
50	Display Pattern Test: Used for the alignment of the CRT display.
52	Calibrator Adjust Test: Used in the adjustment procedure to properly set the Calibrator Signal.
53	20dB Attenuator Adjustment Test: Places the -hp-3561A in a mode of operation used to adjust the A10 Input Assembly 20dB attenuator flatness.
54	40dB Attenuator Adjustment Test: Places the -hp-3561A in a mode of operation used to adjust the A10 Input Assembly 40dB attenuator flatness.
110	Front End Control Register Test: Used in troubleshooting to check the A10 Input Assembly Front End Control Register.
111 through 116	Digitizer Test Register Setups: Used in troubleshooting the A15 Digitizer Assembly. These tests program various circuits on the A15 assembly enabling waveform verification using an oscilloscope.
118	Display Calibration Correction: Prints the Calibration constant on the CRT.
119	Clear Calibration Correction: Resets the Calibration Constant.
120	Digital Filter DSA Test: Programs the A20 Digital Filter Assembly for digital signature analysis. Test Description Number.
121	Timing Counter DSA Test: Programs the Timing Counter IC on the A20 Digital Filter Assembly for troubleshooting.

Table 6-12 (Cont'd)

| 122	DMA Channel G DSA Test: Used to troubleshoot the A20 DMA Channel G address counter circuit using Digital Signature Analysis.
123	DMA Channel R DSA Test: Used to troubleshoot the A20 DMA Channel R address counter circuit using Digital Signature Analysis.
150	Local Oscillator DSA Test: Programs the A50 Assembly for Digital Signature Analysis.
151	Analog Source DSA Test: Used to test the analog portion of the source output. The processor programs the source to output a sinewave of approximately 250Hz at 8Vp-p.
152	Noise Source DSA Setup 1: Programs the A50 Assembly for Digital Signature Analysis.
153	Noise Source DSA Setup 2: Programs the A50 Assembly for Digital Signature Analysis.
154	HP-IB Interface Test: Programs the -hp-3561A to continually read the HP-IB I/O lines and display their state on the CRT.
167	Bubble Memory Read DSA Test: Used to troubleshoot the A65 Bubble Memory Assembly in its Read mode using Digital Signature Analysis.
168	Bubble Memory Bootloop Routine: Rewrites the bootloop in the Bubble Memory. This test can only be accessed and executed through HP-IB. All stored data is destroyed by this test routine.
169	Bubble Memory Reseed Routine: Used to Reseed the Bubble Memory module. This routine requires the use of the Reseed module -hp- Part Number 1818-3304. This module is part of the -hp-3561A Service Kit P/N 03561-80004. Note: This routine causes all data in the Bubble Memory module to be lost.
170	Bubble Memory Format Routine: Used to format the A65 CMOS with Bubble information. This test routine is necessary to run only if the A65 CMOS IC or the battery were replaced. When executed, the instructions will be displayed on the front panel CRT.

6-21 Test Menu Explanation

The Test Menu is the CRT display which defines the softkeys used to access and control the built-in -hp-3561A test routines. The Test Menu is displayed by pressing the following -hp-3561A front panel keys:

    PRESET
    MODE .... TEST SELECT

This will cause the CRT to display the Test Menu shown in Figure 6-31.

Figure 6-31 -hp-3561A Test Menu

                                                               ERR STOP
                                                               ON    OFF

                                                               EXIT
                                                               TST MODE

 -90
 START: 0  Hz         BW: 954.75 Hz       STOP: 100 000 Hz  CONTINUE
```

The following text describes the meaning and uses of each of the Softkey functions.

DEFINE TEST NUMber: Pressing this key allows the operator to enter the test routine number to be executed. When pressed, the CRT will change the softkey definitions to ENTER and CANCEL. At this point, press the front panel numeric keys to define the test routine number. When entering the test routine number from the front panel keyboard, the entries are displayed in the upper left-hand portion of the CRT. If an incorrect number is entered, use the BACK SPACE key or press the CANCEL softkey. Pressing the CANCEL softkey will cause the CRT to display the Test Menu. Press the ENTER menu key to store the number into the instrument and redisplay the test menu.

START SiNGLe TeST: Press this key to execute the test routine once. When pressed, the CRT will indicate that the test is in progress and then complete. Some tests are very short and the "test in progress" may not be seen. Any errors will also be displayed.

6-53

START CONTinuous TeST:	Press this key to loop continuously on a test routine. When pressed, the CRT will indicate that the test is in progress. Also listed on the CRT will be any detected errors or continually updated test results.
STOP TEST:	Pressing this key will halt a test routine which is running.
ERRor STOP ON OFF	Pressing this key toggles the "stop on error" function. When on, the test stops on the first error detected and displays the error return code on the CRT. When off, the test will display any error return code on the CRT and continue executing the test routine.
EXIT TeST MODE:	Pressing this key will cause the instrument to terminate the test mode, execute a PRESET, and display the MODE menu on the CRT. This key is not active while a test is in progress.
CONTINUE:	This key is used by some of the tests which pause to display a message. Pressing this key will cause the test routine to continue its operation.

6-22 General Error Code Format

The general error code format is a CRT displayed message with a three section number. The message is "RETURN CODE =" and the three section number defines the error. The three sections identify the test routine number, the class of error and the error type, in that order. The test routine section can be a one, two or three digit number depending on the test routine number. The class section is always a single digit number from one to nine. The error type is always a two digit number.

For example: RETURN CODE = 1 2 00

In the above example, the error detected is in test routine #1 as indicated by the first section number 1.

The second section is a 2 which indicates a timeout/no trigger problem. The explanation of the second section, error class, is given in Error Class Description following the next paragraph.

The third section is a 00 which indicates a DMA timeout problem. All third section error numbers are unique to the individual test routines. Their meaning is covered in the individual test descriptions in paragraphs 6-23 through 6-51.

ERROR CLASS DESCRIPTION

The second section of the error code indicates the class of error. It is a single digit number from 1 to 9. The classes are explained as follows:

Class 1 =   Programming error which is the case when the processor performs a setup on a circuit and then cannot read or reads back an incorrect setup.

Class 2 =   Timeout error which occurs when a function is triggered or initiated and does not return a "finished" signal within the correct time.

Class 3 =   DTACK error where DTACK is the DaTa ACKnowledge signal used during the handshaking of data. An error results if the DTACK signal does not occur within a time period determined by the particular data transfer.

Class 4 =   Undefined

Class 5 =   Overload error.

Class 6 =   Random/Undefined data error.

Class 7 =   RAM data error.

Class 8 =   ROM checksum error.

Class 9 =   DMA address counter contains incorrect data.

6-23 Test 0 Power-On Test

TEST DESCRIPTION

Test number 0 is automatically run during the initial power-on of the instrument (Test 1 is also run as part of the power-on routine). The power-on test checks the circuit block operations of the A30 FFT/RAM, A40 Main Processor and A60 Digital Display Driver Assemblies. These are the assemblies required to run the operating system. A failure during this test will result in an error message on the CRT display and an error pattern on the -hp-3561A front panel LEDs. Figure 6-32 shows the front panel LEDs used for error detection. The error numbers and their meaning are listed after the explanation of the test. Note that when more than one error is detected, only the first occuring error is indicated by the LEDs and the greater-than-one LED is illuminated. Also indicated by the LEDs is the assembly causing the error. The failing assembly would be the A30 FFT/RAM, A40 Processor or the A60 Digital Display Assemblies. However, all the errors detected are displayed on the CRT.

The circuits of the A30, A40 and A60 Assemblies are tested in the following order:
1. Turn on the front panel LEDs.
2. Check the main RAM on the A30 Assembly by writing and reading a known pattern.
3. Turn off the front panel LEDs.
4. Check the display RAM on the A60 Assembly by writing and reading a known pattern.
5. Turn on the front panel LEDs.
6. Check main ROM on the A40 Assembly by verifying their checksums.
7. Check the DaTACKnowledge signal for proper operation.
8. Turn off the front panel LEDs.
9. Display any errors and initiate the instrument's operating system.
10. Perform Test 1.

DEPENDENCY

Test 0 depends on the proper operation of the following assemblies:

1. A70,A71,A72,A99 Power Supply Assemblies
2. A80 and A81 Front Panel Assemblies or A60,A90 Display Assemblies

Figure 6-32 Front Panel LED Error Indicators For Test 0

Example:

|		
EXT SAMP	- ON	16
AVG	- OFF	0
TIME BUFFER	- OFF	0
MEAS	- ON	2
TRIG	- OFF	0
Return Code =		18

| LED	Description
EXT SAMP	Has a value of 16 in the return code when turned on.
AVG	Has a value of 8 in the return code when turned on.
TIME BUFFER	Has a value of 4 in the return code when turned on.
MEAS	Has a value of 2 in the return code when turned on.
TRIG	Has a value of 1 in the return code when turned on.
ARM	More than one failure occured during the power on test.
RMT	An A40 Assembly failure occured during the power on test.
SRQ	An A60 Assembly failure occured during the power on test.
LTN	An A30 Assembly failure occured during the power on test.

TEST 0 ERROR CODE DESCRIPTION

The following is a list of all the error RETURN CODES which could be displayed during the power-on test 0. Included with the list of error RETURN CODES are their meaning.

RETURN CODE	DESCRIPTION
0 8 01 through 0 8 24	ROM Checksum Error where the defective ROM is identified by the two digit number of the return code. For example, return code 0 3 18 indicates a ROM checksum error in ROM U305 on the A40 Processor Assembly as indicated in the drawing below.

RETURN CODE   **DESCRIPTION**

0 3 25   DTACK error indicating that the Data handshake signal
                    DaTaACKnowledge is not functioning properly.

0 7 26   Main RAM Error determined by writing to and reading from RAM
                    and comparing the actual with the expected value. Also indicated
                    with this error is a Chip Code which is displayed at the bottom of
                    the CRT screen. The Chip Code will be a single hexidecimal
                    number from 0 through F for each failure, indicating which RAM
                    chip is defective. For example, if the Chip Code is B, then RAM
                    U210 on the A30 FFT/RAM Assembly is defective as indicated in
                    the drawing below.

RETURN CODE	DESCRIPTION

0 3 27   Main RAM DTACK Error indicates that the Main RAM
                    DaTaACKnowledge handshake signal is not functioning properly.

0 7 28   Display RAM Error determined by writing to and reading from the
                    Display RAM and comparing the actual with the expected value.
                    Also indicated with this error is a Chip Code which is displayed at
                    the bottom of the CRT screen. The Chip Code will be a single
                    alpha character between G and Z for each failure, which will in-
                    dicate the defective RAM. Use the following Plane Bit Vs. Chip
                    table to determine which Display Ram is defective.

Plane 1 bit: 0 1 2 3 4 5 6 7
Chip Code : G H J K L M N P

Plane 2 bit: 0 1 2 3 4 5 6 7
Chip Code : R T U V W X Y Z

For example, if the RETURN CODE was 0 7 28 with a chip code
of N, this indicates a Display RAM IC error in bit 6 of Plane 1
which is A60U5. See the diagram below to cross-reference the
chip codes with the actual IC.

0 3 29   Display DTACK Error indicates that the Display RAM
                    DaTaACKnowledge handshake signal is not functioning properly.
RETURN CODE   **DESCRIPTIONS**

0 2 30   Unexpected Interrupt indicates that an interrupt was generated
out of sequence.

0 7 31   RAM Refresh Test Error

6-24 Test 1 Quick Functional Test

TEST DESCRIPTION

The Quick Functional Test takes a zoom measurement on the built in 4kHz cal
signal and checks for a correct spectrum. This test is meant to be a global con-
fidence test. The cal signal is input to the A10 Input Assembly and processed
through the entire signal path. This test is run automatically after the Power-On
Test 0. If any errors are detected, their RETURN CODE is displayed on the CRT.

In Test 1, the following takes place:

1. Initialize I/O Ports on the A10 Front End Register, A50 Local Oscillator, A20 DMA,
   A50 Source, and A20 Trigger and Calibrate circuits.
2. Start the A20 Channel G in triggered mode.
3. Initiate and start the A20 FFT.
4. Compare the actual spectrum with the expected.

DEPENDENCY

Test 1 is meant to be a global confidence test. As such, all boards are tested and
must be functionally operational.

TEST 1 ERROR CODE DESCRIPTIONS

The following is a list of all of the error RETURN CODES which could be displayed
during the quick functional test. Included with the list of error RETURN CODES are
their meaning.

RETURN CODE	**DESCRIPTION**
1 1 00	Front End Programming error occurs when the Front End Control Register circuit setup is read by the processor and is found to be incorrectly set.
1 1 01	Timing Counter Programming error indicates that the A20 Timing Counter setup is incorrect.
1 2 00	DMA Timeout error can occur if DMA does not request a data transfer when expected.
1 2 01	Trigger Timeout error indicates the trigger did not occur when expected.
1 2 02	FFT Timeout error indicates that the FFT circuitry did not request a data transfer when expected.
1 2 03	Autozero DMA Timeout error.
1 5 00	Front End/Digital Filter Overload occurs if the Front End Control Register or the Digital Filter circuits overload or if they did not overload when expected.
1 5 01	FFT Overload error indicates the A20 FFT circuitry overloaded or did not overload when expected.
1 6 00	Fundamental incorrect.
1 6 01	Even Harmonic incorrect.
1 6 02	Odd Harmonic incorrect.
1 6 03	DC bin error.
1 6 04	Noise Floor error.

6-25 Test 12 A30 FFT Test

TEST DESCRIPTION

In Test 12, the processor uses the FFT circuitry on the A30 Assembly to perform an FFT on fixed data. The processor then compares the actual results with the expected results.

DEPENDENCY

Test 12 depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A50 Local Oscillator Noise Source Assembly
4. A20 Digital Filter Assembly

TEST 12 ERROR CODE DESCRIPTIONS

RETURN CODE	DESCRIPTION
12 2 00	FFT Timeout error indicating that the A20 FFT circuitry did not request a data transfer when expected.
12 5 00	FFT Overload error indicates that the A20 FFT circuitry overloaded or did not overload when expected.
12 6 00	FFT Auto Scaling error.
12 6 02	Time Buffer Corrupted error.
12 6 05	FFT Output Bad error.
12 6 06	Both errors 02 and 05 occurred.
12 6 07	No FFT Output error.
12 6 08	Both errors 02 and 07 occurred.
12 6 98	Twiddle buffer error.
12 6 99	Window Buffer error.

Fault Isolation

Model 3561A

6-26 Test 13 A20 Timing Counter Test

TEST DESCRIPTION

In this test, the processor uses the Timing Counter on the A20 Assembly to read a fixed clock which tests the operation of the Timing Counter, the processor interface to it and the fixed clock, all of which are on the A20 Digital Filter Assembly. The Timing Counter is tested with two signal frequencies; 2.048 MHz and 5.12 MHz. At each of those frequencies, the Timing Counter's outputs are read by the processor and the data is compared with the expected result. The tested circuits of the A20 Assembly are checked in the following order:

1. The Timing Counter is initialized and verified by the processor through the Timing Counter I/O.

2. The Timing Counter Clock is preset to 2.048 MHz and enabled.

3. The Timing Counter Clock is disabled after 100 mS and the processor reads the output states of the Timing Counter through the Timing Counter I/O.

4. The processor compares the actual data with the expected data and displays any errors on the CRT.

Steps 1 through 3 are repeated with step 2 setting the Timing Counter Clock to 5.12MHz. These two tests are repeated 6 times using a different Timing Counter Circuit setup each time, thereby checking all operating combinations of the Timing Counter IC.

DEPENDENCY

This test depends on the proper operation of the following circuits:

1. A20 Digital Filter Assembly
2. A30 FFT/RAM Assembly

TEST 13 ERROR CODE DESCRIPTIONS

The following is a list of all of the error RETURN CODES which could be displayed during the A20 Timing Counter Test. Included with the list of error RETURN CODES are their meaning.

RETURN CODE	DESCRIPTION
13 1 00 through 13 1 05	Timing Counter Programming error is displayed if the processor reads the Timing Counter after the setup and the result is incorrect. The third section number 00 through 05 indicates which of the six Timing Counter Setups failed.
13 6 00 and 13 6 01	Timing Counter error determined by reading the Timing Counter outputs and verifying that the actual data does not match the expected data.

6-27 Test 14 A20 Digital Filter/DMA Channel R Test

TEST DESCRIPTION

In Test 14, the processor writes data to the A20 Digital Filter Assembly. The Digital Filter then processes the data and transfers the result to RAM. The RAM address is established by the DMA Channel R counters. This test exercises the A20 Digital Filters, the DMA Channel R counters, the RAM BUS Arbitrator and the Channel Select circuits.

DEPENDENCY

This test depends on the proper operation of the following assemblies:

1. A20 Digital Filter Assembly
2. A30 FFT/RAM Assembly

TEST 14 ERROR CODE DESCRIPTIONS

The following is a list of all of the error RETURN CODES which could be displayed during the Digital Filter/DMA test. Included with the list is a description of each of the codes.

RETURN CODE	DESCRIPTION
14 2 00 through 14 2 11	DMA Timeout occurs if the DMA Channel R does not request a DMA transfer when expected. This error can also occur if the Digital Filter IC's do not request a DMA transfer. There are twelve subtests where the DMA transfer request is monitored and a problem in any one can cause a unique RETURN CODE as indicated by the last two-digit number 00 to 11. The twelve subtests are listed following the Test 14 RETURN CODE descriptions.
14 2 20	FFT Timeout error indicates that the A20 FFT circuitry did not request a data transfer when expected.
14 5 00 through 14 5 11	Digital Filter Overload occurs if after the subtest routine, the Digital Filter IC indicates an overload when not expected or does not indicate an overload when expected. There are twelve subtests where an overload can occur as indicated by the last two-digit number (00 to 11) in the RETURN CODE. Those subtests are listed following the Test 14 RETURN CODE descriptions.
14 5 20	FFT Overload error indicates the A20 FFT circuitry overloaded or did not overload when expected.
14 6 00 through 14 6 11	Digital Filter Data Error occurs when the data transferred from the Digital Filter IC to memory is not as expected. There are twelve subtests where a data error can occur as indicated by the last two-digit number of the RETURN CODE. Those twelve subtests are listed next.

TEST 14 SUBTESTS

00   The instrument is programmed to the Local Oscillator and
                                               Digitizer test mode. The test then verifies this setup.

The following 11 subtests alternately check the Real and Imaginary Digital Filter IC's
with the various Decimation Amounts as indicated.

Subtest	Real/Imaginary	Decimation Amount
01	R	0
02	I	0
03	R	/5
04	I	/5
05	R	/10
06	I	/10
07	R	/20
08	I	/20
09	R	/2/10
10	I	/2/10
11	R	/2/5 (Zoom mode)

6-28 Test 18 A20 DMA Channel G and Trigger Test

TEST DESCRIPTION

In this test, the processor checks the Trigger and DMA Channel G counters on the
A20 Digital Filter Assembly by presetting the A20 Trigger circuits and verifying the
setup. It then checks the Channel G DMA counters and their ability to DMA data by
starting a transfer into memory. The data transferred is written to the processor input
port of the Digital Filter ICs and then to memory. The data in memory is then
checked for validity.

DEPENDENCY

This test depends on the proper operation of the following assemblies:

1. A20 Digital Filter Assembly
2. A30 FFT/RAM Assembly

TEST 18 ERROR CODE DESCRIPTIONS

The following is a list of all the error RETURN CODEs which could be displayed during Test 18. Included with the list of error codes are their meaning.

RETURN CODE	DESCRIPTION
18 1 01 through 18 1 06	Timing Counter programming error is displayed if the processor reads the Timing Counter after the setup and the setup is incorrect. The third section number 01 through 06 indicates which of the Timing Counter setups failed.
18 3 01	Unexpected Trigger occurred when the Timing Counter was forced clear.
18 3 02	Unexpected Trigger occurred when the Timing Counter was armed.
18 3 03	Unexpected Trigger occurred when the Timing Counter was forced clear.
18 3 04	Unexpected Trigger occurred when the Timing Counter was forced clear.
18 3 05	Missing Trigger when triggered.
18 3 06	Missing Trigger when forced set.
18 3 07	DMA Channel G not done.
18 5 01	Digital Filter Overload error.
18 6 01	RAM changed during DMA off test.
18 6 02	Digital Filter data bad.
18 8 00 through 18 8 15	DMA Channel G address incorrect when testing block numbers 0 through 15.
18 9 01	DMA Address changed when DMA was off.
18 9 02	DMA Address was incorrect when DMA was enabled.
18 9 03	DMA Address was incorrect when DMA was finished.
18 9 04	DMA Address changed after DMA was completed.

6-29 Test 19 A65/A66 CMOS Memory Test

TEST DESCRIPTION

In this test, the processor checks the operation of the CMOS IC on the A65/A66 Assemblies. The first step in the test is to read all data which is stored in CMOS and place it in main RAM. This is done so the data in CMOS is not destroyed. After the test, the data is written back into CMOS. During the test, the processor writes data into the CMOS memory and then reads it out again. The processor then compares the data and displays any error codes on the CRT display. This test checks the CMOS memory, the processor interface and the CMOS paging circuit.

DEPENDENCY

This test depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A20 FFT/RAM Assembly
4. A50 Local Oscillator/Noise Source Assembly

TEST 19 ERROR CODE DESCRIPTIONS

There is only one error RETURN CODE in the CMOS Test 19. This error code indicates the actual data does not match the expected data. The problem could exist in the CMOS memory IC, the processor interface or the CMOS paging circuit.

The RETURN CODE is 19 6 00.

6-30 Test 20 A65 Bubble Memory Test

TEST DESCRIPTION

In this test, the processor writes data to the A65 Bubble memory module and then reads it back again. The processor then compares the actual data with the expected data. If a mismatch is detected, an error condition exists and an ERROR CODE is displayed on the CRT. This test checks all of the Bubble Memory control circuits, the processor interface and the Bubble Memory module.

6-69

DEPENDENCY

This test depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A20 Digital Filter Assembly
4. A50 Local Oscillator/Source Assembly

TEST 20 ERROR CODE DESCRIPTIONS

The following is a list of all the error RETURN CODES which could be displayed during the A65 Bubble Memory Test. Included with the list of error RETURN CODES are their meaning.

RETURN CODE	DESCRIPTION
20 1 00	No bubble is present or bad communication between the A40 Processor and A65 Bubble Controller.
20 2 00	The Bubble circuitry failed during a read operation.
20 2 01	The Bubble circuitry failed during a write operation.
20 2 02	RETURN CODEs 20 2 00 and 20 6 03 both occured.
20 2 03	RETURN CODEs 20 2 01 and 20 6 03 both occured.
20 6 00	The FIFO in the A65 Bubble Controller is not functioning properly.
20 6 01	The A65 Bootloop Register in the Sense Amplifier is not communicating with the Bubble Controller.
20 6 02	The Bubble cannot be initialized.
20 6 03	Data read from the Bubble memory at initialization does not match the fixed pattern. The first time this test is performed, this failure will occur since the stored pattern will not yet be in place. However, Test 20 checks and writes the fixed pattern twice, and if it fails the second time also, the next RETURN CODE 20 6 04 will be displayed.
20 6 04	Data read from the Bubble memory does not match the fixed pattern. See also RETURN CODE 20 6 03.
20 6 05	RETURN CODEs 20 2 00 and 20 2 01 both occurred.

6-70

6-31 Test 50 Display Pattern Test

TEST DESCRIPTION

In this test, the processor writes to the A60 Digital Display Assembly causing a defined pattern to be displayed on the CRT. This pattern is used in the adjustments to align the CRT display. There are no error codes in this test.

DEPENDENCY

This test depends on the proper operation of the following circuits:

1. A40 Processor Assembly
2. A60 Digital Display Assembly
3. A70,A71,A72,A99 Power Supply Assemblies
4. A90 Analog Display Assembly

TEST 50 ERROR CODE DESCRIPTIONS

There are no error RETURN CODEs in Test 50.

6-32 Test 52 A10 Calibrator Adjustment

TEST DESCRIPTION

In this test, the processor compares the internally generated Calibration signal with an external reference signal. Test 52 programs the -hp-3561A to make a measurement on an external reference with a frequency of 1 kHz and an amplitude of 200 mVrms, and then measure the internal calibrator signal. The difference between the two signals is then calculated and displayed on the CRT display. The adjustment is made to yield a difference of zero. The measurement and display routines are continuous. This allows the real-time adjustment of the internal Calibration signal.

DEPENDENCY

This test depends on the proper operation of all the assemblies with the exception of the A50 Local Oscillator/Noise Source and A65/66 CMOS Bubble Memory Assemblies.

TEST 52 ERROR CODE DESCRIPTIONS

The following is a list of all the error RETURN CODES which could be displayed during Test 52. Also included is description of the error.

RETURN CODE	DESCRIPTION
52 1 00	Front End Programming error occurs when the Front End Control Register circuit setup is read by the processor and is found to be incorrect.
52 1 01	Timing Counter programming error is displayed if the processor reads the A20 Timing Counter after the setup and the setup is incorrect.
52 2 00	DMA/Trigger Timeout error which can occur if DMA does not request a transfer when expected.
52 2 01	Trigger Timeout error indicates the trigger did not occur when expected.
52 2 02	FFT Timeout error indicates that the A20 FFT circuitry did not request a data transfer when expected.
52 2 03	Autozero DMA Timeout error. 52 5 00 Front End/Digital Filter Overload occurs if the Front End Control Register or the Digital Filter circuits overloaded or they did not overload when expected.
52 5 01	FFT Overload error indicates the A20 FFT circuitry overloaded or did not overload when expected.
52 6 00	Input Signal Out-Of-Range.

6-33 Test 53 A10 20dB Flatness Adjustment

TEST DESCRIPTION

In this test, the processor programs the -hp-3561A to make a measurement on the internal Calibration Signal which is programmed to go through the 20dB attenuator on the A10 Assembly. This signal passes through the 20dB attenuator on the A10 Assembly. The measurement is made twice, once at each of two frequencies. Those frequencies are 1 kHz and 64 kHz. The processor then compares the magnitude of the two measurements. The difference in the magnitudes is then displayed on the CRT. This test is run continuously and the CRT is updated approximately every 100 ms.

DEPENDENCY

This test depends on the proper operation of all the assemblies with the exception of the A50 Local Oscillator/Noise Source and A65/66 CMOS Bubble Memory Assemblies.

TEST 53 ERROR CODE DESCRIPTIONS

The following is a list of all the error RETURN CODES which could be displayed during Test 53. Also included is the description of the error.

RETURN CODE	DESCRIPTION
53 1 00	Front End Programming error which occurs when the front end control circuit setup is read by the processor and is found to be incorrect.
53 1 01	Timing Counter programming error is displayed if the processor reads the A20 Timing Counter after the setup and the setup is incorrect.
53 2 00	Dma/Trigger Timeout error which can occur if DMA does not request a transfer when expected.
53 2 01	Trigger Timeout error indicates the trigger did not occur when expected.
53 2 02	FFT Timeout error indicates that the A20 FFT circuitry did not request a data transfer when expected.
53 2 03	Autozero DMA Timeout error.
53 5 00	Front End/Digital Filter Overload occurs if the Front End Control Register or the Digital Filter circuits overloaded or they did not overload when expected.
53 5 01	FFT Overload error indicates the A20 FFT circuitry overloaded or did not overload when expected.

6-73

6-34 Test 54 A10 40dB Flatness Adjustment

TEST DESCRIPTION

In this test, the processor programs the -hp-3561A to make a measurement on the internal Calibrator Signal which is programmed to go through the 40dB attenuator on the A10 Assembly. The calibrate signal passes through the 40dB attenuator on the A10 Assembly. The measurement is made twice, once at each of two frequencies. Those frequencies are 1 kHz and 64 kHz. The processor then compares the magnitude of the two measurements. The difference in the magnitudes is then displayed on the CRT. This test is run continuously and the CRT is updated approximately every 100 mS.

DEPENDENCY

This test depends on the proper operation of all the assemblies with the exception of the A50 Local Oscillator/Noise Source and A65/66 CMOS Bubble Memory Assemblies.

TEST 54 ERROR CODE DESCRIPTIONS

The following is a list of all the error RETURN CODES which could be displayed during Test 54. Also included is the description of the error.

RETURN CODE	DESCRIPTION
54 1 00	Front End Programming error which occurs when the front end control circuit setup is read by the processor and is found to be incorrect.
54 1 01	Timing Counter programming error is displayed if the processor reads the A20 Timing Counter after the setup and the setup is incorrect.
54 2 00	Dma/Trigger Timeout error which can occur if DMA does not request a transfer when expected.
54 2 01	Trigger Timeout error indicates that the trigger did not occur when expected.
54 2 02	FFT Timeout error indicates that the A20 FFT circuitry did not request a data transfer when expected.

RETURN CODE	DESCRIPTION
54 2 03	Autozero DMA Timeout error.
54 5 00	Front End/Digital Filter Overload occurs if the Front End Control Register or the Digital Filter circuits overloaded or if they did not overload when expected.
54 5 01	FFT Overload error indicates that the A20 FFT circuitry overloaded or did not overload when expected.

6-35 Test 110 A10 Front End Control Register Test

TEST DESCRIPTION

Test 110 is used for troubleshooting the Front End Control Register on the A10 Input Assembly and the Test Control Register circuitry on the A15 Assembly. The processor sends a clock which is latched by the Front End Register. This is repeated for as long as Test 110 is allowed to run. This process generates defined states on the outputs of the Registers which enable Digital Signature Analysis or oscilloscope waveform analysis to be performed.

CAUTION

This test routine should not be used for periods longer than 30 minutes or the A10 relays may be damaged.

There are no error RETURN CODEs in Test 110.

DEPENDENCY

This test depends on the proper operation of all the assemblies with the exception of the A50 Local Oscillator/Noise Source and A65/66 CMOS Bubble Memory Assemblies.

6-36 Test 111 Through 116 A15 Timing And Control Circuit Setups

TEST DESCRIPTION

These tests are used to setup the A15 Timing And Control circuitry for trouble-shooting. There are six setups which completely test the A15 Timing and Control circuitry.

> **NOTE**
> *These setup tests cannot be changed by the operating system. It is important to exit these test modes by pressing the softkey EXIT TEST or by pressing the front panel PRESET key when you are finished with troubleshooting.*

There are no error RETURN CODEs in Tests 111 through 116.

DEPENDENCY

These tests depend on the proper operation of all the assemblies with the exception of the A50 Local Oscillator/Noise Source and A65/66 CMOS Bubble Memory Assemblies.

6-37 Test 118 Display Calibration Constants

TEST DESCRIPTION

Test routine 118 causes the Calibrate Correction Constants to be displayed on the CRT. This test disrupts normal instrument operation if PRESET or EXIT TEST mode keys are not pressed to exit Test 118. After initiating the test routine, press the MODE key to display the normal measurement screen. Use the MARKER to display the desired Calibrate Correction. In the Frequency display, the MARKER value X indicates the frequency and Y indicates the Calibrate Correction. In the Phase display, the MARKER value X indicates degrees and Y indicates the Calibration Correction.

There are no error RETURN CODEs in Test 118.

6-38 Test 119 Clear Calibration Constant

TEST DESCRIPTION

Test routine 119 resets the Calibrate Constant to zero. This test disrupts normal instrument operation if PRESET or EXIT TEST mode keys are not pressed to exit Test 119.

There are no error RETURN CODEs in Test 119. *SEC* 6-39 Test 120 A20 Digital Filter DSA

6-39 Test 120 A20 Digital Filter DSA

TEST DESCRIPTION

Test 120 is used to troubleshoot the A20 Digital Filter circuits. The processor continually writes to the Digital Filter allowing Digital Signature Analysis.

There are no error RETURN CODEs in Test 120.

DEPENDENCY

Test 120 depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A50 Local Oscillator/Noise Source Assembly

6-40 Test 121 A20 Timing Counter DSA

TEST DESCRIPTION

Test 121 is used to troubleshoot the Timing Counter and associated circuitry on the A20 Digital Filter Assembly using Digital Signature Analysis.
There are no error RETURN CODEs in Test 121.

DEPENDENCY

Test 121 depends on the proper operation of the following assemblies:

1. A20 Digital Filter Assembly
2. A30 FFT/RAM Assembly

6-77

6-41 Test 122 A20 DMA Channel G DSA

TEST DESCRIPTION

Test 122 is used to set up the A20 Digital Filter Assembly for troubleshooting the DMA Channel G circuitry using an oscilloscope to check the output timing waveforms.

There are no error RETURN CODEs in Test 122.

DEPENDENCY

Test 122 depends on the proper operation if the following assemblies:

1. A20 Digital Filter Assembly
2. A30 FFT/RAM Assembly

6-42 Test 123 A20 DMA Channel R DSA

TEST DESCRIPTION

Test 123 is used to set up the A20 Digital Filter Assembly for troubleshooting the DMA Channel R circuitry using an oscilloscope to check the output timing waveforms.

There are no error RETURN CODEs in Test 123.

DEPENDENCY

Test 123 depends on the proper operation of the following assemblies:

1. A20 Digital Filter Assembly
2. A30 FFT/RAM Assembly

6-43 Test 150 A50 Local Oscillator DSA

TEST DESCRIPTION

This test sets up the A50 PRN circuitry for troubleshooting using Digital Signature Analysis.

There are no error RETURN CODEs in Test 150.

DEPENDENCY

Test 150 depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A65/66 CMOS Bubble Memory Assembly

6-44 Test 151 A50 Analog Source Test

TEST DESCRIPTION

Test 151 programs the -hp-3561A to output an 8Vp-p 250Hz sinewave signal out the rear panel SOURCE BNC connector. This test is used to verify proper operation of the built-in source signal. It checks both the digital and the analog circuitry.

There are no error RETURN CODEs in Test 151.

DEPENDENCY

Test 151 depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A65/66 CMOS Bubble Memory Assembly

6-45 Test 152 A50 Noise Source DSA Setup 1

TEST DESCRIPTION

Test 152 is used to troubleshoot the Noise Source circuitry on the A50 Assembly using Digital Signature Analysis and oscilloscope waveform analysis.

There are no error RETURN CODEs in Test 152.

DEPENDENCY

Test 152 depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A65/66 CMOS Bubble Memory Assembly

6-46 Test 153 A50 Noise Source DSA Setup 2

TEST DESCRIPTION

Test 153 is used to troubleshoot the PRN ROM using Digital Signature Analysis and oscilloscope waveform analysis.

There are no error RETURN CODEs in Test 153.

DEPENDENCY

Test 153 depends on the proper operation of all the assemblies with the the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A65/66 CMOS Bubble Memory Assembly

6-47 Test 154 A50 HP-IB I/O Verification Test Routine

TEST DESCRIPTION

In this test, the HP-IB I/O circuitry is checked for proper operation. Test 154 is a user interactive test. While the test is running, the HP-IB connector pins must be shorted to ground, one pin at a time. When this is done, the CRT will so indicate. The HP-IB connector is located on the rear panel of of the -hp-3561A. See Figure 6-33 for the pinout configuration.

There are no error RETURN CODEs in Test 154.

Note: Test 154 can only be accessed through the front panel.

Figure 6-33 HP-IB Connector Pinout Configuration
{CAUTION}

The -hp-3561 contains metric threaded HP-IB cable mounting studs as opposed to English threads. Metric threaded -hp-10833A, B, C or D HP-IB cable lockscrews must be used to secure the cable to the instrument. Identification of the two types of mounting studs and. lockscrews is made by their color. English threaded fasteners are colored silver and metric threaded fasteners are colored black. DO NOT Mate silver and black fasteners to each other or the threads of either or both will be destroyed. Metric threaded HP-IB cable hardware illustrations and part numbers follow.

NOTE
The HP-IB is Hewlett-Packard implementation of IEEE std 488-1978, "Standard Digital Interface for Programmable Instrumentation."

THESE PINS ARE INTERNALLY GROUNDED

LOCKSCREW 1390-0360   LONG MOUNTING STUD 0380-0643   SHORT MOUNTING STUD 0380-0644

6.5mm   4.9mm
HP-IB Interconnect Cables

Part Number	Length
10833A	1 m (3.3 ft)
10833B	2 m (6.6 ft)
10833C	4 m (13.2 ft)
10833D	0.5 m (1.6 ft)

TEST OPERATING PROCEDURE

Use the following procedure to initiate and operate the HP-IB I/O Verification
Routine:

1. Program the -hp-3561A to run Test 154 by pressing the following front panel
    keys:

    PRESET
    MODE . . . .   TEST SELECT . . . . .154 ENTER
                               START CONT . . . . . . TeST

The CRT should indicate that Test 154 is in progress and to press the STOP TEST key
to ABORT the test. The STOP TEST key must be pressed to exit this test! Failure to
do this will result in -hp-3561A operating errors! The CRT should also display the
HP-IB I/O connector signal names, pin numbers and pin-state in six columns as
shown next:

DIO1	1	O	O	13	DIO5
DIO2	2	O	O	14	DIO6
DIO3	3	O	O	15	DIO7
DIO4	4	O	O	16	DIO8
EOI	5	O	O	17	REN
DAV	6	O	O	18	GND
NRFD	7	O	O	19	GND
NDAC	8	O	O	20	GND
IFC	9	O	O	21	GND
SRQ	10	O	O	22	GND
ATN	11	O	O	23	GND
SHLD	12	O	O	24	IGND

where columns one and six identify the signal names, columns two and five identify
the connector pin numbers and columns three and four identify the state of the pins
(O indicates a high state).

2. Short the I/O pins to chassis (ground) one at a time. The shorted pin will cause
    the CRT to display a # instead of an O next to the corresponding pin number.

    For example: Short pin number 1 of the HP-IB connector to ground. This will
                 cause the CRT to display

                 DIO1   1   #   instead of   DIO1   1   O

    No other pins should be affected. If any other pins are affected, troubleshoot
    the HP-IB circuitry.

Only pin 11, ATN, will cause changes to other pins. When pin 11 is is grounded, the CRT will display the following:

DIO1	1	?	?	13	DIO5
DIO2	2	?	?	14	DIO6
DIO3	3	?	?	15	DIO7
DIO4	4	?	?	16	DIO8
EOI	5	?	?	17	REN
DAV	6	?	O	18	GND
NRFD	7	?	O	19	GND
NDAC	8	?	O	20	GND
IFC	9	?	O	21	GND
SRQ	10	?	O	22	GND
ATN	11	#	O	23	GND
SHLD	12	O	O	24	IGND

Note that the SHLD and GND pins will never change. Their state will always display a O.

Remember, press the STOP TEST key before changing test modes or exiting Test 154.

DEPENDENCY

Test 154 depends on the proper operation of the following circuits:

1. A30 FFT/RAM Assembly

6-48 Test 167 A65 Bubble Memory Read DSA

TEST DESCRIPTION

Test 167 is used to troubleshoot the A65 Bubble Memory Assembly using Digital Signature Analysis. In this test, the processor continually reads a fixed pattern from record 128 of the Bubble Memory module. Note that this test does not destroy any data stored in the Bubble Memory module.

DEPENDENCY

Test 167 depends on the proper operation of all the assemblies with the exception of the following:

1. A10 Input Assembly
2. A15 Digitizer Assembly
3. A20 Digital Filter Assembly
4. A50 Local Oscillator/Noise Source Assembly

TEST 167 ERROR CODE DESCRIPTIONS

There is only one error RETURN CODE in Test 167. It is 167 1 00. This error indicates that the A65 Assembly is not installed or that the communication between the A65 Assembly and the A40 Processor is not functioning properly.

6-49 Test 168 A65 Bubble Memory Bootloop Routine

TEST DESCRIPTION

Test Routine 168 is used to rewrite the Bootloop into the Bubble Memory module. The purpose of the Bootloop is to provide a map that shows which storage loops are good and which are defective. This map is stored internally to the Bubble Memory module. It is also copied on a label on the outside of the Bubble Memory module (A65 U4) which is used by this routine. The Bootloop also contains a synchronization code which is used in positioning the data storage loops to provide a physical address reference.

The Bootloop will normally never need to be rewritten during the useful life of the Bubble Memory module. However, when the Bootloop is rewritten, all data stored in the Bubble Memory module is lost.

Note: This test routine can only be accessed through HP-IB!

BOOTLOOP ROUTINE OPERATING PROCEDURE

The Bootloop Routine requires an -hp-9836 HP-IB controller. The program listed in the following pages must first be loaded into the controller. To run the program, answer the prompts which will be displayed on the controller CRT. The prompts are explained following the error code descriptions.

TEST 168 ERROR CODE DESCRIPTIONS

There is only one error RETURN CODE in Test 168. It is 168 1 00. This error indicates that the A65 Bubble Memory Assembly is not installed or that the communication between the A40 Processor and the A65 Bubble Memory Assemblies is not functioning properly.

BOOTLOOP PROGRAM PROMPT EXPLANATIONS

{CAUTION}

Turn power off before removing or installing the A65 Assembly.

There are two methods to load the Bootloop program into the controller. The first method is to type the program listed in the following pages into the controller and pressing RUN. The second method is to load the program from the 5¼ inch floppy disk P/N 03561-69400 and pressing RUN. If the 5¼ inch floppy disk is available, use the following procedure to load and run the Bootloop program:

1. Insert the floppy disk P/N 03561-69400 into the right drive of the -hp-98364 Controller.

2. Type "LOAD BOOTLOOP" and press the RUN key.

All operating instructions are displayed on the controller CRT and explained in the following paragraphs.

After loading the basic program into the controller, type RUN to begin. The first screen will say to remove the A65 Bubble Memory assembly and copy the bootloop. The bootloop is located on the Bubble Memory module label. The following is an example:

```
7110-1                     Part number
PYI03          8251        Date code
FFDBDFFBBFBBFF9F
BBFFFBFF77FFFBFF
FFFFFF9FFDFFEFFF           Bootloop (hexadecimal characters)
FFFFBFDD7DEFFFFD
FDF5FFCF8C9D9BF9
```

Carefully copy the bootloop onto a piece of paper. It will be entered into the controller later. It is important to copy the bootloop accurately since entering the incorrect bootloop will harm the Bubble Memory module necessitating its replacement.

After replacing the A65 Assembly and powering the instrument, set the HP-IB address to 11. Do this by pressing:

LCL . . . .   DEFINE ADDRESS . . . . .11 ENTER

After the address has been programmed and the -hp-3561A and controller have been cabled together, press the CONTINUE key on the controller.

The current bootloop in the Bubble Memory module will be read and displayed on the controller's CRT. Also displayed will be selections to:

1. Edit the bootloop displayed on the controller's CRT
2. Rewrite the displayed bootloop to the Bubble Memory module
3. Exit the bootloop routine and return the -hp-3561A to local control

6-85

EDIT mode allows the displayed bootloop to be modified using the cursor arrows, backspace key or space bar. Move the cursor over the incorrect bootloop element and type the correct hexadecimal character. To exit the edit mode, press the ENTER key on the controller and the three selection functions will again be displayed on the CRT.

REWRITE mode causes the CRT displayed bootloop to be written to the -hp-3561A Bubble Memory module. When this is performed, the display will ask if the bootloop is correct. If N, you will be allowed to re-edit. If Y, the bootloop will be written. After writing, the controller reads the new bootloop and compares it to the bootloop just written. If they match, the program is completed. If there is a mismatch, the controller will display the message:

AN ERROR WAS DETECTED IN SENDING THE BOOTLOOP, TRY AGAIN

and display the three selection functions on the CRT. Type 2 to rewrite the bootloop. If the above message is again displayed, perform Test Routine 169 "A65 Bubble Memory Reseed Routine." After which, again try to write the bootloop. If the failure is still present, troubleshoot the HP-IB or Bubble Memory assemblies.

EXIT mode aborts the program in an orderly fashion and returns the -hp-3561A to local control.

```
10    ! THIS PROGRAM IS A SERVICE ROUTINE USED WHEN SERVICING
20    ! THE ATLAS BUBBLE MEMORY BOOTLOOP.  WHEN RUN, THE PROGRAM WILL
30    ! DISPLAY THE CURRENT BOOTLOOP STORED IN THE BUBBLE MEMORY. IF IT
40    ! APPEARS TO BE CORRECT. THE USER MAY THEN EXIT THE TEST.  IF THERE
50    ! IS AN ERROR IN THE BOOTLOOP THE USER MAY CALL UP A SCREEN EDITOR,
60    ! EDIT THE BOOTLOOP AND THEN WRITE THE NEW BOOTLOOP TO THE BUBBLE
70    ! MEMORY.  IF THERE IS A MISMATCH OF THE BOOTLOOP SENT AND THE
80    ! BOOTLOOP READ. THE USER IS NOTIFIED TO TRY AGAIN.

6-50 Test 169 A65 Bubble Memory Reseed Routine

TEST DESCRIPTION

Test Routine 169 is used to Reseed the Bubble Memory module. This Routine requires a special electronic Reseed module which plugs into the IC socket of U102 on the A65 Bubble Memory Assembly. This Reseed module is -hp- part number 1818-3304 and is part of the -hp-3561A Service Accessory Kit -hp- part number 03561-84401.

A bubble is generated in the Bubble Memory module by replicating a seed bubble that is always present at the GEN element which is inside the module. If this seed is lost or destroyed, it will be necessary to run this routine.

RESEED ROUTINE OPERATING PROCEDURE

1. With the line power switch OFF, remove the A65 Bubble Memory Assembly.

2. Remove U102 and install the Reseed module 1818-3304 into U102's socket being careful to orient pin 1 properly as shown in Figure 6-34.

Figure 6-34 Reseed Module Installed Properly.
3. Install U102 into the Reseed module being careful to orient pin 1 properly.

4. Place a clip lead across 47Ω resistor R104 effectively connecting U4(1,6) directly to +12V.

5. Install the A65 Assembly into the -hp-3561A using an extender board -hp- part number 03561-66596. An extender board must be used because the Reseed module and U102 IC combination will not have enough clearance to be installed in the instrument.

6. Turn the -hp-3561A power ON.

7. After the power-on routine, program the instrument to run Test 169 by pressing the following front panel keys:

     MODE . . . .   TEST SELECT. . . . .169 ENTER NTER

8. Begin the routine by pressing the softkey START SiNGLe TEST.

9. The CRT will ask if the Reseed Module is in place and to press CONTINUE if it is. Press CONTINUE.

The Reseed routine will take less than one second.

10. When the Reseed routine is finished, turn the line power switch off and remove the clip lead and Reseed module, and reinsert U102 into the A65 Assembly.

Although it is not necessary, it is good practice to check the Bootloop of the Bubble Memory whenever it is necessary to Reseed. Do this by running Test 168. *SEC* 6-51 Test 170 Format Nonvolatile Memory Routine

6-51 Test 170 Format NonVolatile Memory Routine

TEST DESCRIPTION

Test Routine 170 is used to format the optional A65 Assembly. The format routine will initialize the CMOS IC with the Bubble Memory information. This test routine will normally only be necessary to run if the A65 CMOS IC or the battery were replaced.

TEST 170 OPERATING INSTRUCTIONS

Use the -hp-3561A Test Menu to initialize Test 170. Press the softkey START SiNGLe TeST to execute. The instructions will be displayed on the CRT display.

TEST 170 ERROR CODE DESCRIPTIONS

There are two error RETURN CODEs in Test 170. They are listed and explained below.

RETURN CODE	DESCRIPTION
170 2 00	Bubble Initialize Timeout error occurs if the A65 bubble controller does not respond to the processor.
170 6 00	Bubble Bootloop Data error occurs when the processor cannot read data from the bootloop register

6-52 Overall Instrument Theory of Operation

6-53 Introduction to Theory of Operation

An overview of the -hp-3561A operation is given here to illustrate some of the primary interactions between the individual circuit boards. The 3561A's control circuits and bus structure are described first, followed by a description of the measurement data flow. A detailed circuit description for each circuit board is given is Section Seven. A simplified instrument block diagram is given in Figure 6-34, the assembly locations are given in Figure 6-35, and a detailed block diagram is given in Figure 6-36.

Figure 6-34 -hp-3561A Simplified Block Diagram
6-54 Control Circuits and Bus structure

INSTRUMENT CONTROL

The -hp-3561A is controlled by a 68000 microprocessor on the A40 Assembly. The microprocessor, ROM and other circuits on the A40 assembly are referred to here as the central processor. The central processor directs all activity required for the -hp-3561A to accept, process, and display measurement data. When power is initially applied to the the -hp-3561A, the central processor runs a self test and then configures the -hp-3561A circuits to preset conditions. The central processor then moni-

tors the front panel for new instructions. When a front panel key is pressed, the central processor programs the -hp-3561A circuits to implement the keyed instruction.

The -hp-3561A uses the processor bus and the RAM bus for instrument control and data transfer. The processor bus and RAM bus both consists of a 16 bit address bus and a 16 bit data bus. The processor bus is controled by the central processor, and the RAM bus is controlled by the RAM bus arbitrator on the A30 Assembly. Because the -hp-3561A uses a two bus structure, two activities can take place at the same time (e.g., The processor can access the display over the processor bus at the same time as the digital filter is accessing RAM over the RAM bus).

PROCESSOR BUS

The processor address bus and data bus are used by the central processor to send instructions to the various -hp-3561A circuits and to transfer data to display. The processor address bus is a 16 bit single direction bus which is partially decoded on the A40 Assembly to generate select lines. Select lines are used to address a particular functional block. The functional block then decodes the remaining address lines to determine the exact circuit addressed. The processor data bus is a 16 bit bi-directional bus. Over this bus, the processor writes data to, or reads data from the addressed circuit.

RAM BUS

The RAM bus is used by three circuits to transfer data to and from the instrument RAM. The three circuits are the FFT processor, the central processor, and the digital filter. To prevent a bus contention, the RAM bus arbitrator uses a priority decoder to control access to both the RAM address bus and data bus. The FFT processor has top priority, the digital filter second, and the central processor third. To access the RAM bus, a circuit issues a RAM bus request. The RAM bus arbitrator compares the priority of the bus request to the priority of any other bus requests it has received and issues a bus grant to the highest priority requester. The circuit receiving the bus grant has access to the RAM bus until a higher priority bus request is received.

6-55 Measurement Data Flow

FFT MEASUREMENTS

The -hp-3561A uses the Fast Fourier Transform (FFT) to convert time domain data into frequency domain data. The FFT is a mathematical algorithim which is implemented in a microprocessor on the A30 Assembly called the FFT processor. The FFT processor is the heart of the -hp-3561A. Most other circuits in the -hp-3561A are provided to support the FFT processor by either preparing the input data to be transformed, or by transferring the FFT results to the CRT display.

The FFT processor operates on blocks of 1024 time domain data samples resulting in 512 frequency and 512 phase values.

INPUT AMPLIFIER (A10 ASSEMBLY)

The first step in processing the input signal is to scale its amplitude to the correct value for the A/D converter. This scaling is accomplished in the input amplifier cir- cuits on the A10 Assembly. The gain of the input amplifer is set by the front panel range setting. An input sine wave with an amplitude equal to the range setting will be scaled to an amplitude of .228 Vrms at the input to the A15 Assembly.

ANTI-ALIAS FILTER AND A/D CONVERTER (A15 ASSEMBLY)

After it is scaled by the input amplifier, the input signal is passed through the 100 kHz low pass anti-alias filter. This filter prevents aliasing which occurs as part of the sampling process in the A/D converter.

At the output of the anti-alias filter, the input signal has been fully conditioned to be digitized. The analog-to-digital converter always samples the input signal at a 256 kHz rate (except in external sample mode). For each sample, the A/D converter outputs a 13 bit digital value to the digital filter.

DIGITAL FILTER (A20 ASSEMBLY)

The digital filter is a low-pass filter with a pass-band frequency span equal to the selected display frequency span. The digital filter processes data serially, that is the digital filter inputs only one data sample at a time and produces one output value for each input value. The digital filter outputs are stored directly into RAM. The RAM address where the data is stored is determined by the direct memory access (DMA) circuit. Because the FFT processor operates on blocks of 1024 data samples, the DMA circuit stores the digital filter output values in blocks of 1024 outputs each. Each block of 1024 values is called a time record. The first data sample of a time record is determined by one of five possible triggers: input trigger, internal trig- ger, external trigger, source trigger, or HP-IB trigger. When a trigger is received, the DMA circuit stores the next 1024 digital filter output values into a time record. When the time record has been filled, the DMA circuit issues a DMA interrupt signal to the central processor to indicate that the time record is ready for processing by the FFT processor.

FFT PROCESSOR (A30 ASSEMBLY)

On receipt of a DMA interrupt, the central processor performs a window function on the data if a window is selected, and then issues an FFT RESET signal to the FFT pro- cessor. The FFT RESET signal indicates to the FFT processor that a complete time record is stored in RAM and is ready for processing. The FFT processor then per- forms a fast fourier transform on the time record, resulting in 512 frequency and 512 phase values. The FFT results are then stored into the frequency buffer location of

the instrument RAM. When the FFT processor completes a transform, it issues an FFT interrupt signal to the central processor to indicate that the data is ready to be displayed.

POST PROCESSING AND DISPLAY

When the central processor receives an FFT interrupt signal, it determines whether the data should be directly transferred to the display or whether some post processing is required such as a math function or third octave display. The processor performs any post processing required while the data is stored in the instrument RAM. When the post processing is complete, the processor transfers the data to the appropriate location in the display memory depending on the display type chosen.

MEASUREMENTS WHEN THE FREQUENCY SPAN IS LESS THAN 100 kHz

To obtain maximum frequency resolution when the frequency span is less than 100 kHz, the input data is resampled after it has been digitally filtered. The new sample rate can be calculated by multiplying 256 kHz by 100 and then dividing by the selected frequency span. Thus if a frequency span of 20 kHz is selected, the new sample rate is 51.2 kHz. To obtain a sample rate of 51.2 kHz, four out of every five digital filter outputs are discarded, and only one out of five are stored in RAM.

ZOOM MODE OPERATION

Because the digital filter and the FFT processor can only process signals in a frequency span centered at 0 Hz, the -hp-3561A is equipped with a digital local oscillator. The purpose of the local oscillator is to mix the the signals in the selected frequency span down to an equivalent span centered at 0 Hz. The signals can then be digitally filtered, and transformed by the FFT processor. The local oscillator output signal is set to a frequency equal to the center frequency of the selected span (e.g., for a 20 kHz span centered at 50 kHz, the local oscillator will have a frequency of 50 kHz). This signal is then multiplied with the sampled input signal. The multiplication occurs inside the digital filter, but before the the digital filtering takes place.
